Executive Summary

The Chicago Transit Authority (CTA), as project sponsor to the Federal Transit Administration (FTA), proposes to extend the Red Line heavy rail transit service 5.6 miles south from the existing 95th/Dan Ryan terminal to Chicago's Far South Side. The Red Line provides rapid transit services 24/7 and is the most heavily traveled rail line in the CTA system. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line.

Since circulation of the Draft Environmental Impact Statement (EIS) on October 6, 2016, the CTA and FTA have continued to advance the Red Line Extension (RLE) Project and obtain documentation needed for the Final EIS. CTA has evaluated public and agency feedback received on the Draft EIS during the formal comment period in 2016 and undertaken additional agency and railroad coordination to select the Preferred Alignment for the RLE Project, announced to the public on January 26, 2018. Documentation of coordination and outreach activities since the announcement of the Preferred Alignment can be found in **Chapter 5**. The Preferred Alignment is a hybrid of the East and West Options of the Union Pacific Railroad (UPRR) Alternative presented in the Draft EIS.

In 2019, CTA began exploring an opportunity to relocate the 130th Street station, the terminating station of the RLE Project, to a location south of 130th Street. The Draft EIS had originally proposed the station location north of 130th Street. In 2017, after publication of the Draft EIS, the Chicago Housing Authority (CHA) demolished Blocks 11, 12, and 13 of the Altgeld Gardens neighborhood, creating an opportunity to relocate the station south of 130th Street to the area of the demolished blocks. The demolition of Blocks 11, 12, and 13 of Altgeld Gardens was an activity completed by CHA and was independent and unrelated to the RLE Project. CTA evaluated the station relocation for feasibility. Meetings were held with partner agencies and stakeholder groups of residents in the station area with these agencies and groups expressing support for the station relocation. CTA is therefore proposing a location change for the 130th Street station. The change would relocate the station from north of 130th Street, as presented in the Draft EIS, to south of 130th Street, adjacent to the Altgeld Gardens neighborhood.

After the announcement of the Preferred Alignment in 2018, CTA continued stakeholder coordination and design efforts. Norfolk Southern Railway (NS) shared their considerations for future potential access to Canadian National/Metra Electric District (CN/MED) tracks to the north of Kensington Yard and the national freight rail network at that location. This access would allow restoration of a former connection that the Michigan Central Railroad had with the CN/MED tracks, which were then owned by the Illinois Central Railroad. The 120th Street yard and shop presented in the Draft EIS would preclude future potential access to All American Recycling. The All American Recycling facility is served by the NS via trackage rights with the Indiana Harbor Belt Railroad (IHB). This coordination with NS resulted in adjustments to the

Preferred Alignment near the 120th Street yard and shop. The 120th Street yard and shop and the tracks south to 130th Street were shifted approximately 100 feet to the west to accommodate the NS railroad access to the All American Recycling and the national freight rail network.

CTA reviewed multiple locations for a cross-over area (i.e., CTA aerial structure over UPRR tracks [hereafter, 107th Place cross-over]) that would maximize the benefits and reduce the impacts of the UPRR East and West Options. The UPRR provided comments on the Draft EIS where they expressed their preference for the West Option due to concerns for the East Option's proximity to their tracks. All hybrid options under consideration started with the West Option and crossed over from the west to the east side of the UPRR tracks north of 115th Street. The hybrid option was presented to the public as the Preferred Alignment on January 26, 2018. Comparative analysis of parcel impacts and alignment with the goals of the RLE Project identified the vicinity of 108th Place as the cross-over location that would provide the greatest benefit. The cross-over in the vicinity of 108th Place would preserve viable businesses; minimize impacts to schools, residences, and the historic Roseland Pumping Station; and preserve parcels slated for future development surrounding the station areas. However, additional engineering refined the alignment further, which moved the UPRR crossing north from 108th Place to 107th Place. The refinement would lower the 111th Street station platform height; would lower the profile of the elevated structure, providing for a smoother overall profile; and would place the crossing at 107th Place.

The National Environmental Policy Act of 1969 (NEPA) mandates the consideration of environmental impacts before approval of any federally funded project that may have significant impacts on the environment or where impacts have not yet been determined (42 United States Code [USC] § 4332). FTA and CTA prepared this RLE Project Supplemental Environmental Assessment (EA) in accordance with NEPA and other applicable regulations to evaluate changes in project design from those analyzed in the Draft EIS. The purpose of this Supplemental EA is to evaluate impacts from the station location change, as well as to evaluate any impacts from design changes resulting from the selection of the Preferred Alignment. The design changes discussed in the Supplemental EA include:

- 130th Street station relocation
- 120th Street yard and shop refinement
- 107th Place cross-over

This document is organized to present impacts that are new or differ from those discussed in the Draft EIS. This document contains the following chapters, and the project design changes are discussed in the order presented above.

- Chapter 1 Introduction

- Chapter 2 Description of Proposed Changes to the Project
- Chapter 3 Environmental Impacts and Mitigation
- Chapter 4 Section 4(f) Evaluation
- Chapter 5 Public Involvement and Agency Coordination
- Chapter 6 References
- Chapter 7 List of Acronyms and Abbreviations

This Supplemental EA serves as the primary document to facilitate public and agency review of the proposed design changes since the circulation of the Draft EIS. CTA has established a 30-day comment period to take formal comments on the Supplemental EA. The Supplemental EA is available on the CTA website (https://www.transitchicago.com/RLE/SEA), and hard copies of the Supplemental EA are available at the following locations during the public review period:

- Federal Transit Administration – Region 5 Office, 200 W. Adams Street, Suite 320, Chicago, IL, 60606
- CTA headquarters, 567 W. Lake Street, 2nd Floor, Chicago, IL 60661
- Pullman Public Library, 11001 S. Indiana Avenue, Chicago, IL 60628
- West Pullman Public Library, 830 W. 119th Street, Chicago, IL 60643
- Altgeld Public Library, 955 E. 131st Street, Chicago IL 60827
- Woodson Regional Public Library, 9525 S. Halsted Street, Chicago, IL 60628
- Calumet Park Public Library, 1500 W. 127th Street, Calumet Park, IL 60827
- Harold Washington Library Center, 400 S. State Street, Chicago, IL 60605

The public hearing will be held in two formats: one virtual meeting and one in-person meeting. The virtual hearing will be on February 15, 2022 from 6:00 to 8:00 PM. The virtual hearing will be compliant with the Americans with Disabilities Act (ADA), including closed captioning and Spanish and American Sign Language interpreters for the entirety of the public hearing. The in-person meeting will be at The Salvation Army Kroc Center, 1250 W. 119th Street, Chicago, IL 60643 on February 17, 2022 from 6:00 to 8:00 PM. The location of the in-person hearing will be ADA compliant and is accessible by public transit. Each public hearing will solicit comments from agencies and the community about findings presented in the Supplemental EA. The in-person hearing will be conducted in an open house format.

All substantive comments received during the public hearing and the 30-day public comment period will be addressed in the Final EIS/Record of Decision (ROD), submitted to FTA, and entered into the public record. A summary of the public hearing will be included in the Final EIS. Written comments will also be accepted at any time during the public comment period via e-mail to: RedExtension@transitchicago.com and U.S. mail to: Chicago Transit Authority, Strategic Planning, 10th Floor, Attn: Red Line Extension Project, 567 W. Lake Street, Chicago, IL 60661-1465.

Potential adverse environmental impacts, best management practices, and mitigation measures for each environmental resource identified for each project design change are detailed in **Chapter 3** of the Supplemental EA and are summarized in **Table ES-1**.

Table ES-1: Summary of Impacts and Mitigation

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
Transportation		
There would be no adverse impacts on Transportation after mitigation. Permanent • 130th Street and Ellis Avenue intersection would have insufficient turning lane lengths attributable to the construction of the relocated 130th Street station. Signal timing adjustments and extending the eastbound right turn and westbound left turn storage lanes on 130th Street are proposed to address this impact. There would be no adverse impacts to intersection operations after mitigation. • Closure of Old 130th Street would eliminate one of three access routes to Carver Military Academy High School. Closure of this access would not result in adverse impacts because the primary access from 130th Street to Greenwood Avenue and 132nd Street would remain and be improved as part of the RLE Project. The secondary access from Doty Avenue would remain unchanged. No mitigation would be required. • Closure of Old 130th Street would eliminate a connection to the access road into the Beaubien Woods Forest Preserve from Old 130th Street. However, the main access route to the Beaubien Woods Forest Preserve would continue to be from Ellis Avenue to Greenwood Avenue to 132nd Street. See summary section in **Section 4(f)** for mitigation measures. • The 130th Street station access road would impact an entrance and parking spaces to TCA Health. Mitigation measures would include redesign of the parking lot to maintain three entrance and exit points, and replacement of impacted parking spaces at a minimum ratio of 1 to 1. The redesign of	• No changes to impacts from the Draft EIS.	• No changes to impacts from the Draft EIS.

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
the parking lot would be done in coordination with TCA Health and would provide the required number of ADA parking spaces. The parking lot would also meet the City of Chicago Landscape Ordinance. Construction • Construction of the 130th Street station access road would temporarily impact an entrance and parking spaces to TCA Health. The temporary displacement of parking during construction would be mitigated by existing on-street parking along Old 130th Street and Greenwood Avenue. • There could be some limited increases in traffic instances in the Altgeld Gardens neighborhood due to construction equipment and material delivery. CTA would phase construction to minimize impacts on local neighborhood traffic. • Improvements at the 130th Street and Ellis Avenue intersection would involve temporary lane closures during construction. • Flagging operations and scheduled track closures would occur near or adjacent to railroad tracks, as required.		
Land Use and Economic Development		
There would be no adverse impacts on Land Use and Economic Development after mitigation. Permanent • The closure of Old 130th Street would eliminate a connection to the access road to the Beaubien Woods Forest Preserve from Old 130th Street. See summary discussion in the **Transportation** section. • The 130th Street station access road would impact an entrance and parking spaces to TCA Health. See summary discussion in the **Transportation** section.	• No changes to impacts from the Draft EIS.	• No changes to impacts from the Draft EIS.

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
• Closure of Old 130th Street would eliminate one of three access routes to Carver Military Academy High School. See summary discussion in the **Transportation** section. The closure of Old 130th Street would not result in an adverse impact to Carver Military Academy High School. • The 130th Street station would require a zoning change for both the parcels within the station footprint and two City-owned parcels that would be used as mitigation for the Forest Preserves of Cook County (FPCC) impacts. See summary section in **Section 4(f)** for mitigation measures. Construction • Construction would cause new temporary impacts to Altgeld Gardens residents and Carver Academy students such as noise, dust, and traffic. • Construction of the 130th Street station access road would temporarily impact an entrance and parking spaces to TCA Health. See summary discussion in the **Transportation** section. There would be no adverse construction impacts on land use or economic development.		
Displacements and Relocation of Existing Uses		
There would be no adverse impacts from displacements and relocation of existing uses after mitigation. Permanent • Four new parcels would need to be acquired for construction of the relocated 130th Street station (two directly impacted for the construction of the RLE Project and two acquired as mitigation for FPCC impacts). Three of these parcels are vacant; one has a commercial building although the building would not be displaced. See summary section in **Section 4(f)** for mitigation measures.	• No changes to impacts from the Draft EIS.	**There would be no adverse impacts from displacements and relocation of existing uses after mitigation.** Permanent • Ten new parcels would need to be acquired for construction of the 107th Place cross-over (four have buildings and six are vacant). • CTA would work with the property owners to acquire the property in

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
- CTA would work with the property owners (TCA Health, City, and CHA), to acquire the property in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as applicable. Construction - Construction of the 130th Street station access road would temporarily impact an entrance and parking spaces to TCA Health. See summary discussion in the **Transportation** section.		accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970. Construction - Construction of the cross-over could impact access to some parcels, limiting the use of those parcels. - Mitigation measures would include maintenance of traffic plans that maintain access to residents and businesses. Access may be limited for short periods of time. Alternative access would be identified and regularly communicated to property and business owners.
Neighborhoods and Communities		
There would be no adverse impacts on Neighborhoods and Communities with the exception of visual impacts after mitigation. Permanent - There would be adverse visual impacts on the Altgeld Gardens residents resulting from the relocation of the 130th Street station. The proposed four-level park & ride facility would	- No changes to impacts from the Draft EIS.	**There would be no adverse impacts on Neighborhoods and Communities with the exception of visual impacts after mitigation.** Permanent - There would be adverse visual impacts on the residential neighborhood on the east of the UPRR tracks from the construction of the 107th Place cross-over. See summary discussion in the **Visual and Aesthetic Conditions** section.

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
substantially alter the residential scale and character. The adverse impacts would remain after mitigation. - Closure of Old 130th Street would eliminate one of three access routes to Carver Military Academy High School. See summary discussion in the **Transportation** section. - The 130th Street station would impact an entrance and parking spaces to TCA Health. See summary discussion in the **Transportation** section. - Mobility would be impacted due to access to the Carver Military Academy High School being changed. See summary discussion in the **Transportation** section. The closure of Old 130th Street would not result in an adverse impact to Carver Military Academy High School. - Mobility would also be impacted due to the closure of Old 130th Street and elimination of the connection to the access road into the Beaubien Woods Forest Preserve from Old 130th Street. See summary discussion in the **Transportation** section. See summary section in **Section 4(f)** for mitigation measures. Construction - Neighborhoods and community resources would be accessible during construction. Construction of the 130th Street station access road would impact an entrance and parking spaces to TCA Health. See summary discussion in the **Transportation** section.		
Visual and Aesthetic Conditions		
There would be an adverse impact on Visual and Aesthetic Conditions after mitigation.	- No changes to impacts from the Draft EIS.	**There would be an adverse impact on Visual and Aesthetic Conditions after mitigation.**

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
Permanent • The residential character and scale would be altered by the removal of vegetation and the addition of the proposed four-level park & ride facility, other structures, and station. There would be adverse impacts on visual and aesthetic conditions. • Mitigation measures would include landscaping and designing the facility to match the fabric of the surrounding community. The adverse impacts would remain, even after mitigation. Construction • There would be no new construction impacts on visual and aesthetic conditions.		Permanent • The elevated structure at the 107th Place cross-over would alter the residential character and scale for residences on the east side of the structure. The existing vegetation would not effectively block the views from adjacent residences, permanently changing the visual setting of the area, resulting in adverse impacts. • Mitigation measures would include landscaping and using urban design techniques to reduce massing. Techniques that may be used include planting larger trees near structures to break the sight lines and incorporating smaller-scale landscaping near the streets. The adverse impacts would remain, even after mitigation. Construction • There would be no new construction impacts on visual and aesthetic conditions.
Noise and Vibration		
There would be no impacts on Noise and Vibration conditions.	• No changes to impacts from the Draft EIS.	• No changes to impacts from the Draft EIS.

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
Permanent • A detailed noise and vibration analysis was completed for the relocated 130th Street station. Noise measurements were taken at representative sensitive receivers, and the analysis determined there would be no noise impacts due to the relocated 130th Street station. • There would be no vibration impacts due to the relocated 130th Street station. Construction • There would be no new construction noise or vibration impacts due to the relocated 130th Street station. Construction best management practices to reduce noise and vibration are described in the Draft EIS.		
Historic and Cultural Resources		
There would be a No Adverse Effect finding on the 60 historic properties and one historic district.	• No changes to impacts from the Draft EIS.	• No changes to impacts from the Draft EIS.
Hazardous Materials		
There would be no adverse impacts on Hazardous Materials. Permanent • There was one off-site recognized environmental condition (REC) identified. The off-site REC (Conrail tracks) would be a potential impact on hazardous materials. Impacts associated with adjacent freight railroads were discussed in the Draft EIS. There would be no new adverse impacts due to hazardous materials.	• On-site RECs were identified during the Corridor Level Phase I Environmental Site Assessment (ESA). A Phase II ESA will be conducted for the yard and shop and included in the Final EIS.	• On-site and off-site RECs were identified during the Corridor Level Phase I ESA. Site specific Phase I ESAs will be conducted as required and included in the Final EIS. Phase II ESA will be conducted, as needed. The Phase II ESAs would be included in the Final EIS.

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
Construction • There would be no new adverse construction impacts due to hazardous materials.		
Wetlands		
There would be no adverse impacts on Wetlands after mitigation. Permanent • The track alignment extension connecting to the relocated 130th Street station would impact approximately 0.21 acre of wetlands north of the 130th Street station relocation project area. No wetlands would be impacted directly by the relocated 130th Street station footprint. The 130th Street station in the Draft EIS would impact approximately 7 acres of wetlands. The relocated 130th Street station would result in a reduction in wetland impacts. • The Approved Jurisdictional Determination associated with the 2015 Wetland Delineation Report in the Draft EIS expired in June 2021. Field conditions in the project area for the 130th Street station relocation would be evaluated in a wetland delineation, as may be needed for permitting. During a site review meeting on May 11, 2021, a potential wetland was identified north of 132nd Street and west of the Beaubien Woods Forest Preserve access road. The U.S. Army Corps of Engineers (USACE) concurred with the original determination that wetlands identified in the project area are non-jurisdictional. An updated Approved Jurisdictional Determination letter was submitted to USACE on September 15, 2021. Coordination with USACE will continue through the Final EIS. No additional wetland delineation was requested. If requested, a report would be prepared summarizing the findings of the wetland delineation. This report would be shared during the permitting process. Impacts on any	• No changes to impacts from the Draft EIS. Permanent • The 2015 Wetland Delineation Report in the Draft EIS expired in June 2021. A new wetland delineation would be conducted to evaluate field conditions in the project area, if required for permitting or coordination. • The Approved Jurisdictional Determination associated with the 2015 Wetland Delineation Report in the Draft EIS expired in June 2021. Field conditions in the project area for the 120th Street yard and shop would be evaluated in a wetland delineation, as may be needed for permitting. During a site review meeting on May 11, 2021, the area covered by the original Approved Jurisdictional Determination was analyzed for potential connectivity. A potential wetland area dominated by common reed was identified between the roadway and the All American Recycling facility. USACE concurred with the original determination that wetlands identified in the project area are non-jurisdictional. An updated	• No changes to impacts from the Draft EIS.

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
delineated wetlands would be coordinated with USACE, including request of an updated Approved Jurisdictional Determination, as needed. Impact coordination would proceed as needed based on the results of any Approved Jurisdictional Determination. Construction • Since no new wetlands have been identified, there would be no new construction impacts on wetlands. • Mitigation measures would include avoidance and minimization of temporary wetland disturbance for construction access and staging areas to the extent practicable. Wetlands would be clearly marked in the construction plans to ensure the contractor avoids wetland disturbance. Best management practices (BMPs), such as erosion and sediment control measures, would be implemented to prevent deposition and degradation of any wetlands near the project area.	Approved Jurisdictional Determination letter was submitted to USACE on September 15, 2021. Coordination with USACE will continue through the Final EIS. No additional wetland delineation was requested. If requested, a report would be prepared summarizing the findings of the wetland delineation. This report would be shared with USACE during the permitting process. Impacts on any delineated wetlands would be coordinated with USACE, including request of an updated Approved Jurisdictional Determination, as needed. Impact coordination would proceed as needed based on the results of any Approved Jurisdictional Determination. Construction • Since no new wetlands have been identified, there would be no new construction impacts on wetlands. • Mitigation measures would include avoidance and minimization of temporary wetland disturbance for construction access and staging areas to the extent practicable. Wetlands would be clearly marked in the construction plans to ensure the contractor avoids wetland disturbance. BMPs, such as erosion and sediment control measures, would be implemented to prevent deposition and degradation of any wetlands near the project area.	

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
Environmental Justice		
There would be no adverse impacts on Environmental Justice (EJ) populations after mitigation. Permanent • There would be no disproportionately high and adverse permanent impacts on EJ populations. Construction • There would be no disproportionately high and adverse construction impacts on EJ populations.	• No changes to impacts from the Draft EIS.	• No changes to impacts from the Draft EIS.
Safety and Security		
There would be no adverse impacts on Safety and Security after mitigation. Permanent • Access to the relocated 130th Street station from Altgeld Gardens would not require crossing 130th Street. The relocated station would reduce adverse safety and security impacts from those disclosed in the Draft EIS. • The closure of Old 130th Street would not adversely impact emergency access to Carver Military Academy High School. Construction • Mitigation measures would include maintenance of traffic and job site safety and security during construction.	• No changes to impacts from the Draft EIS.	• No changes to impacts from the Draft EIS.

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
• There would be no adverse construction impacts on safety and security.		
Air Quality		
There would be no adverse impacts on Air Quality after mitigation. Permanent • Additional vehicular traffic on nearby streets would not result in an exceedance of air quality standards for carbon monoxide, and no adverse impacts would occur. • No changes to regional emissions of greenhouse gases, particulate matter, and mobile source air toxics were identified from those disclosed in the Draft EIS. Construction • Impacts during construction would include temporary and localized emissions of fugitive dust and exhaust from construction vehicles and equipment. There would be no new adverse construction-related impacts on air quality. BMPs, such as the Construction Emission Control Checklist developed by the U.S. Environmental Protection Agency (USEPA), would be implemented to reduce construction dust and use of low-sulfur fuels, among others.	• No changes to impacts from the Draft EIS.	• No changes to impacts from the Draft EIS.
Water Resources		
There would be no adverse impacts on Water Resources after mitigation. Permanent • The relocated 130th Street station would be located within the Illinois Coastal Management Program boundary. CTA has coordinated with the Illinois Department of Natural Resources	• No changes to impacts from the Draft EIS.	• No changes to impacts from the Draft EIS.

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
(IDNR) for the federal consistency review. CTA submitted an initial federal consistency review to IDNR on August 27, 2021.On a letter dated October 8, 2021, IDNR concurred that the relocated 130th Street station would comply with the enforceable policies of the Illinois Coastal Management Program and would be conducted in a manner consistent with the Illinois Coastal Management Program. • There would be no adverse permanent impacts on the Illinois coastal zone. Construction • There would be no new construction-related impacts on water resources. BMPs would be implemented to minimize erosion and sedimentation on nearby water resources.		
Biological Resources		
There would be no adverse impacts on Biological Resources after mitigation. Permanent • The removal of up to approximately 5.7 acres of trees in the vicinity of the relocated station would be an adverse impact to biological resources. Reduction in habitat would occur but would not constitute a substantial loss compared to larger natural areas available associated with the Beaubien Woods Forest Preserve. The loss of trees would reduce migratory bird habitat. • Mitigation measures would include timing of vegetation removal and nesting bird surveys. • A tree survey may be needed for permitting and/or local tree protection ordinances to assess the number, species, and health status of trees to be removed. If the tree survey is required, CTA would coordinate tree removal with the U.S.	**There would be no adverse impacts on Biological Resources after mitigation.** Permanent • There is only 0.9 new acre of trees impacted by the 120th Street yard and shop refinement. Reduction in habitat would occur but would not constitute a substantial loss due to fragmented areas that are somewhat isolated by surrounding industrial and transportation uses. The loss of trees would reduce migratory bird habitat. • Mitigation measures would include timing of vegetation removal and nesting bird surveys. • A tree survey may be needed for permitting and/or local tree protection	• No change to impacts from the Draft EIS.

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
Fish and Wildlife Service (USFWS) and local authorities, as necessary. • The rufa red knot (*Calidris canutus rufa*), the northern long-eared bat (NLEB) (*Myotis septentrionalis*), and the rusty patched bumble bee (RPBB) (*Bombus affinis*) were added to the federal list for Cook County since the Draft EIS analysis. o No suitable habitat for the rufa red knot was identified in the project area. Therefore, the rufa red knot is unlikely to occur in the project area. o Suitable bat roost trees are not expected to be in this area. A “no effect” determination for the rufa red knot and a “may affect, not likely to adversely affect” determination for the NLEB were received from USFWS on September 28, 2021. o The project area is outside the range of the RPBB, as identified by the USFWS Environmental Conservation Online System. • On November 24, 2021, IDNR finalized its Illinois Ecological Compliance Assessment Tool (EcoCAT) review. The EcoCAT indicated records for the osprey (*Pandion haliaetus*) and the Lake Calumet Illinois Natural Area Inventory site. IDNR recommends the following mitigation measures: o For protection of the osprey, removal of vertical structures such as telephone poles and light poles would be done between November 1 and March 31. o If these dates could not be accommodated, a nesting survey would be conducted to determine if species are utilizing structures in the project area. Survey results and methodology will be coordinated with IDNR. o For the protection of wildlife associated with Lake Calumet, all lighting would be fully shielded fixtures that emit no light upward. o Only “warm-white” or filtered light emitting diode (LED) (CCT < 3,000 K; S/P ratio <1.2) would be used to minimize blue emission.	ordinances to assess the number, species, and health status of trees to be removed. If the tree survey is required, CTA would coordinate tree removal with USFWS and local authorities, as necessary. • The rufa red knot (*Calidris canutus rufa*), the NLEB (*Myotis septentrionalis*), and the rusty patched bumble bee (RPBB) (*Bombus affinis*) were added to the federal list for Cook County since the Draft EIS analysis. o No suitable habitat for the rufa red knot was identified in the project area. Therefore, the rufa red knot is unlikely to occur in the project area. o Suitable bat roost trees have a minimal likelihood of being present. A “no effect” determination for the rufa red knot and a “may affect, not likely to adversely affect” determination for the NLEB were received from USFWS on September 28, 2021. o The project area is outside the range of the RPBB, as identified by the USFWS Environmental Conservation Online System. • On November 24, 2021, IDNR finalized its EcoCAT review. 130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
o Only the exact space would be lit with the amount (lumens) needed to meet industry safety requirements. Construction • As discussed in the Permanent list above, trees would be removed in the project area, reducing the urban tree inventory, and potentially impacting migratory birds and urban-adapted wildlife through removal of roosting areas. • Mitigation measures described in the Permanent list above would minimize construction-related impacts on biological resources. Typical mitigation measures for the protection of the NLEB are proposed such as tree removal activities to occur outside of the NLEB active season (April 1 through October 31). • Mitigation measures described in the Permanent list above would also minimize construction-related impacts on the osprey and wildlife associated with Lake Calumet.	o For protection of the osprey, removal of vertical structures such as telephone poles and light poles would be done between November 1 and March 31. o If these dates could not be accommodated, a nesting survey would be conducted to determine if species are utilizing structures in the project area. Survey results and methodology will be coordinated with IDNR. o For the protection of wildlife associated with Lake Calumet, all lighting would be fully shielded fixtures that emit no light upward. o Only "warm-white" or filtered light emitting diode (LED) (CCT < 3,000 K; S/P ratio <1.2) would be used to minimize blue emission. o Only the exact space would be lit with the amount (lumens) needed to meet industry safety requirements. Construction • As discussed in the Permanent list above, trees would be removed in the project area, potentially impacting migratory birds and urban-adapted wildlife through removal of roosting areas. • Any removal of suitable roost trees would have the potential to impact the NLEB.	

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
	- Mitigation measures described in the Permanent list above would minimize construction-related impacts on biological resources. Typical mitigation measures for the protection of the NLEB are proposed such as tree removal activities to occur outside of the NLEB active season (April 1 through October 31). - Mitigation measures described in the Permanent list above would also minimize construction-related impacts on the osprey and wildlife associated with Lake Calumet.	
Indirect and Cumulative		
There would be no adverse indirect or cumulative impacts. Cumulative - The removal of the buildings on the three CHA blocks within Altgeld Gardens has contributed cumulatively on the relocation of the 130th Street station.	- No changes to impacts from the Draft EIS.	- No changes to impacts from the Draft EIS.
Section 4(f)		
There would be no use of Section 4(f) resources after mitigation. - Construction of the 130th Street station would close Old 130th Street and eliminate a connection to the access road into the Beaubien Woods Forest Preserve from Old 130th Street. With implementation of mitigation measures identified in coordination with FPCC, there would be no use of Section 4(f) resources. The main access route to the Beaubien Woods Forest Preserve would continue to be from Ellis Avenue to Greenwood Avenue to 132nd Street.	- No changes to impacts from the Draft EIS. No presence of or use of Section 4(f) resources.	- No changes to impacts from the Draft EIS. No presence of or use of Section 4(f) resources.

130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
• Mitigation measures include: o Transfer of two City-owned parcels into FPCC ownership. o $250,000 payment to FPCC for ecological restoration, habitat enhancement, and beautification of expanded Beaubien Boat Launch land. o New trail connection from Altgeld Gardens recreation facilities on 133rd Street to the Beaubien Woods Boat Launch. o Wayfinding and information signage inside the proposed station and outdoor signage at 130th Street and Ellis Avenue and other locations. o Forest Preserve advertising to encourage CTA riders to use public transportation to visit the Forest Preserves at the 130th Street station, other Red Line stations south of Roosevelt, and inside local trains and buses.		

Chapter 1 Introduction

1.1 Project Background

The Chicago Transit Authority (CTA) and the Federal Transit Administration (FTA) published a Draft Environmental Impact Statement (EIS) on October 6, 2016 that evaluated the environmental impacts of constructing and operating the Red Line Extension (RLE) Project. The RLE Project would extend the Red Line from the existing 95th/Dan Ryan terminal to 130th Street. The proposed 5.6-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Multimodal connections at each new station would include bus, bike, pedestrian, and park & ride facilities.

The proposed rail extension would run south along I-94 Bishop Ford Freeway from 95th/Dan Ryan terminal, then curve west along the north side of I-57 Expressway (within the I-57 right-of-way) for nearly ½ mile until reaching the Union Pacific Railroad (UPRR) corridor near Eggleston Avenue. The alignment would then turn south to follow the UPRR corridor.

Two UPRR Rail Alternative options, the East and West Options, were evaluated as part of the Draft EIS. Both options would follow the UPRR corridor, either east or west of the existing UPRR corridor, to Prairie Avenue, where they would cross over the Metra Electric District (MED) tracks near 119th Street. South of 119th Street, the East and West Options would follow the same alignment southeast along the Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad (NICTD/CSS & SBRR) right-of-way using a portion of the Norfolk Southern Railway (NS) and Consolidated Rail Corporation (Conrail) right-of-way to the terminus of the RLE at 130th Street.

CTA selected a Preferred Alignment of the UPRR Alternative and announced it to the public on January 26, 2018. The Preferred Alignment is a hybrid of the East and West Options of the UPRR Alternative presented in the Draft EIS. **Figure 1-1** shows the Preferred Alignment.

Three changes are proposed and identified subsequent to evaluation under the Draft EIS. First, an opportunity to relocate the station south of 130th Street arose after the Chicago Housing Authority (CHA) demolished Blocks 11, 12, and 13 of the Altgeld Gardens neighborhood. This demolition was independent from the RLE Project. As a result of continued outreach efforts since 2018, CTA is proposing a location change for the 130th Street station, the terminating station of the RLE Project. The change would relocate the station from north of 130th Street, as presented in the Draft EIS, to south of 130th Street, adjacent to Altgeld Gardens. With the relocation of the 130th Street station, the RLE Project length increased from 5.3 to 5.6 miles from the existing 95th/Dan Ryan terminal to Chicago's Far South Side. This Supplemental Environmental

Assessment (EA) is an evaluation to determine if there are any new impacts from the 130th Street station location change.

This Supplemental EA also evaluates impacts that would result from two additional design modifications made to the RLE Project after publication of the Draft EIS. These design changes include modifications to the 120th Street yard and shop and the addition of the 107th Place cross-over (i.e., CTA aerial structure over UPRR tracks [hereafter, 107th Place cross-over]) to accommodate the hybrid alignment.

These three changes and design modifications of the RLE Project are described in further detail in **Chapter 2**.

1.2 Project Purpose and Need

The purpose of the RLE Project is as follows:

- Reduce commute times for residents both within and south of the project area.
- Improve mobility and accessibility for transit-dependent residents in the project area.
- Improve rapid transit rail service to isolated areas and provide viable linkages between affordable housing (e.g., the Altgeld Gardens neighborhood), jobs, services, and educational opportunities, thereby enhancing livability and neighborhood vitality.
- Provide an opportunity for potential connections and linkages to other public transportation modes, including regional commuter rail in the project area.
- Foster economic development in the project area, where new stations may serve as catalysts for neighborhood revitalization and help reverse decades of disinvestment in local business districts.
- Provide a modern, efficient railcar storage yard and shop facility to provide storage and cost-effective preventive maintenance for railcars associated with the RLE Project, railcars currently stored in the existing 98th Yard and Shop, and railcars supporting additional Red Line expansion of service.

Figure 1-1: Preferred Alignment

The need for the RLE Project is demonstrated by the following existing conditions and is described in more detail in the Draft EIS Appendix D Purpose and Need Report:

- Transit trips to jobs are longer for Far South Side residents than they are for residents in the Chicago seven-county region[1] as a whole.
- Transit-dependent populations in the project area have limited direct access to rapid transit rail service.
- The project area is geographically isolated from major activity centers and provides residents limited viable transportation options, which limits access between affordable housing (e.g., the Altgeld Gardens neighborhood) and employment centers outside of the project area.
- Existing transit markets are underserved, and transit connectivity is challenging in the project area.
- Disinvestment and limited economic development in the project area have negatively affected Far South Side communities.
- The existing 98th Yard does not have capacity to store railcars for any substantial increase in Red Line capacity accompanying future Red Line expansion.

The Draft EIS further documents the elements of the purpose and need for the RLE Project. The purpose and need for the project have not changed as a result of the 130th Street station relocation and design modifications for the 120th Street yard and shop and 107th Place cross-over.

---

[1] The Chicago seven-county region includes the counties of Cook, DuPage, Kane, Kendall, Lake, McHenry, and Will.

Chapter 2 Description of Proposed Changes to the Project

The Draft EIS discussed the alternatives previously considered during the alternatives development process, and it presented both the East and West Options of the UPRR Alternative (**Figure 2-1**). Impacts resulting from the East or West Options were disclosed, and proposed mitigation measures were presented in the Draft EIS. After the publication of the Draft EIS, CTA continued to refine the RLE Project and selected the Preferred Alignment, which is a combination of the UPRR East and West Options (see **Figure 2-1**). The Preferred Alignment maximizes the benefits of both the East and West Options and minimizes the range of impacts that would come from the selection of one option over the other. The impacts and mitigation measures proposed for the Preferred Alternative will be presented in the Final EIS document and informed by both the Draft EIS, Preferred Alternative, and findings of this Supplemental EA.

This Supplemental EA evaluates the design change areas related to the Preferred Alignment that were not evaluated in the Draft EIS and would not, therefore, have provided the public the opportunity to understand the potential for impacts and whether those impacts would be significant. Displacements and relocations for the Preferred Alignment are shown in **Attachment B**. The attachment is updated from the displacements and relocations presented in 2018 as part of the announcement of the Preferred Alignment.

This chapter describes the three areas along the Preferred Alignment where design changes warrant an evaluation of whether new impacts would occur from those disclosed in the Draft EIS. This evaluation enables the public to review and to provide input on new impacts from design changes proposed. FTA considers the public's input as FTA determines whether or not the new impacts would be significant, and what additional mitigation measures would be required. **Figure 2-1** shows the UPRR East and West Options as presented in the Draft EIS beside the Preferred Alignment that highlights the design change areas presented in this chapter. The three design changes are listed below and described in detail in this chapter:

1. 130th Street station relocation
2. 120th Street yard and shop refinement
3. 107th Place cross-over

Chapter 3 discusses those environmental resources that would experience a change in impacts from those identified in the Draft EIS as a result of the design changes. **Table 2-1** summarizes the environmental resources discussed in **Chapter 3** under each design change.

Table 2-1: Summary Table of Environmental Resources with Changes to Impacts

Design Change	130th Street Station Relocation	120th Street Yard and Shop Refinement	107th Place Cross-over
Transportation	X		
Land Use and Economic Development	X		
Displacements and Relocations of Existing Uses	X		X
Neighborhoods and Communities	X		X*
Visual and Aesthetic Conditions	X		X
Noise and Vibration	X		
Historic and Cultural Resources	X		
Hazardous Materials	X		
Wetlands	X	X	
Environmental Justice	X		
Safety and Security	X		
Air Quality	X		
Water Resources	X		
Biological Resources	X	X	
Indirect and Cumulative Impacts	X		

*Although the Neighborhoods and Communities resource would not experience new or different impacts from those identified in the Draft EIS, the "X" acknowledges that the modification of the Visual and Aesthetic Conditions does affect the community even though it is evaluated as a separate resource.

The conclusions and analysis of the Supplemental EA will be incorporated into the Final EIS for the Preferred Alignment. The Final EIS will include responses to the public and agency comments received during the Supplemental EA public comment period.

2.1 130th Street Station Relocation

The Draft EIS proposed a terminal station, the 130th Street station, located north of 130th Street adjacent to the Metropolitan Water Reclamation District of Greater Chicago (MWRD) Calumet Water Reclamation Plant. This location was selected and determined to be the most viable option for the RLE Project's terminus station at the time of the Draft EIS. However, there were concerns about pedestrians needing to cross 130th Street to access the station. The ability to connect the transit station to the Altgeld Gardens neighborhood was limited due to the existing four-lane roadway that would separate the neighborhood from the proposed station. In addition, the station would be located with MWRD facilities on both sides of it, so concerns were raised about potential odors from the wastewater treatment plant.

In 2017, after publication of the Draft EIS, CHA demolished Blocks 11, 12, and 13 of Altgeld Gardens, creating an opportunity to relocate the station south of 130th Street to the area of the demolished blocks. The demolition of Blocks 11, 12, and 13 of Altgeld Gardens was an activity completed by CHA and was independent and unrelated to the RLE Project. In 2019, CTA began exploring a possibility to relocate the 130th Street station to this location south of 130th Street. CTA evaluated the station relocation for feasibility. Meetings were held with partner agencies and stakeholder groups with these agencies and groups expressing support for the station relocation. CTA is, therefore, proposing a location change for the 130th Street station.

The change would relocate the station from north of 130th Street, as presented in the Draft EIS, to south of 130th Street, adjacent to the Altgeld Gardens neighborhood as shown in **Figure 2-1**. The station area concept, which is preliminary and under evaluation, is shown in **Figure 2-2**. **Attachment A, Sheets CT-1029 to CT-1030** and **CT-1037 to CT-1038** contains plans and profiles for the 130th Street station relocation. The station platform would be at-grade, located south of 130th Street. A station entrance would be located at the terminus of the extension north of 132nd Street. A five-bay bus turnaround would be located to the west of the main station for direct transfers. A four-level park & ride facility would be located northwest of the station platform, with another station entrance at the top level to bridge over the tracks to access the station platform for park & ride transfers. The 130th Street station parking layout would accommodate future parking expansion if the parking demand increases. CTA Transportation Offices would also be located at the terminus, with a connection to the park & ride facility and nearby station entrance. The Transportation Offices would include office space and restroom facilities for station personnel.

Figure 2-2: Conceptual Layout of the 130th Street Station Relocation

The proposed station south of 130th Street would offer many benefits over the north station location, including:

- Creating better transit connections with the existing bus services that run within the Altgeld Gardens neighborhood.
- Providing pedestrian access to the station using neighborhood roadways while not having to cross 130th Street.
- Being closer and more accessible for Altgeld Gardens' residents and Carver Military Academy High School students.
- Providing safer and more secure access for transit users by avoiding the need to use a walking path under the 130th Street viaduct or cross 130th Street at-grade.
- Providing better transit access to the Beaubien Woods Forest Preserve.
- Being farther from the MWRD plant and the odors potentially associated with it.

- Avoiding interaction with truck traffic entering and exiting the MWRD plant.
- Better opportunities for future development.
- Supporting objectives in the 2013 *Altgeld Gardens - Philip Murray Homes Master Plan* for improving transportation options and access to jobs, services, and retail.

2.2 120th Street Yard and Shop Refinement

The 120th Street yard and shop would provide a larger, modern railcar storage and repair facility for CTA at the south end of the RLE Project and would replace the function of the existing 98th Yard and Shop as a maintenance facility. The property selected for the yard and shop was originally a rail yard for the Michigan Central Railroad, known as the Kensington Yard. NS now owns the Kensington Yard property, which has had all the yard trackage removed. Presently, only a single spur track exists, providing rail access to the All American Recycling facility at 11900 S. Cottage Grove Avenue from the south.

After the announcement of the Preferred Alignment, CTA continued stakeholder coordination and design efforts. NS shared their considerations for future potential access to Canadian National/Metra Electric District (CN/MED) tracks to the north of Kensington Yard and the national freight rail network at that location. This access would allow restoration of a former connection that the Michigan Central Railroad had with the CN/MED tracks, which were then owned by the Illinois Central Railroad. The restoration of the former connection would not be part of the RLE Project. The 120th Street yard and shop presented in the Draft EIS would have precluded future potential access to those tracks as well as access to All American Recycling, located west of the railroad tracks (11900 S. Cottage Grove Avenue). The All American Recycling facility is served by the NS via trackage rights with the IHB. This coordination with NS resulted in adjustments to the Preferred Alignment near the 120th Street yard and shop to accommodate:

- 100-foot-wide right-of-way for the NS line immediately west of the NICTD/CSS & SBRR.
- Future connection from the NS track to Canadian National Railway (CN) tracks along the MED corridor.
- Maintain connection from the NS tracks to the All American Recycling facility.
- Rail connection to facilitate rail delivery of ballast, ties, and other material to CTA.

Therefore, the 120th Street yard and shop and the tracks south to 130th Street were shifted approximately 100 feet to the west to accommodate the NS railroad access to the All American Recycling and the national freight rail network as described above. This shift resulted in the project footprint expanding into areas that were not included in the previous analysis disclosed in the Draft EIS. **Attachment A, Sheets CT-1021** to **CT-1028**, **CT-1032** to **CT-1036**, and **CT-1039** to **CT-1041**, contains plans and profiles for the 120th Street yard and shop refinement.

2.3 107th Place Cross-over

Based on public feedback received on the Draft EIS as well as subsequent project planning and engineering work, the Preferred Alignment for the RLE Project was selected in 2018. The Preferred Alignment is a combination of both the UPRR East and West Options. Engineering was conducted to determine the optimum location to cross over the UPRR tracks. CTA reviewed multiple locations for a cross-over area that would maximize the benefits and reduce the impacts of the East and West Options.

The UPRR provided comments on the Draft EIS where they expressed their preference for the West Option due to concerns for the proximity of the East Option to their tracks. UPRR noted that the location of the Roseland Pumping Station could not accommodate UPRR's requested clearance of 25 feet between the centerlines of the UPRR's potential tracks and the proposed East Option. Therefore, all hybrid options considered in selecting the Preferred Alignment started with the West Option and crossed over from the west to the east side of the UPRR tracks south of the pumping station and north of 115th Street to minimize property impacts.

The hybrid option was presented to the public as the Preferred Alignment on January 26, 2018. Comparative analysis of parcel impacts and alignment with the goals of the RLE Project identified the vicinity of 108th Place as the cross-over location that would provide the greatest benefit. The cross-over in the vicinity of 108th Place would preserve viable businesses; minimize impacts to schools, residences, and the historic Roseland Pumping Station; and preserve parcels slated for future development surrounding the station areas. However, additional engineering refined the alignment further, which moved the UPRR crossing north from 108th Place to 107th Place. The refinement would lower the 111th Street station platform height; would lower the profile of the elevated structure, providing for a smoother overall profile; and would place the crossing at 107th Place.

The interface over UPRR begins north of 107th Street where the extension is along the west side of the UPRR corridor. As it continues south, the extension begins to curve east until it crosses over the UPRR corridor just north of 107th Place. By 109th Street, the extension has completed the shift and is now along the east side of the UPRR corridor. **Figure 2-1** shows the UPRR East and West Options from the Draft EIS and the location of the 107th Place cross-over that is part of the Preferred Alignment. **Attachment A, Sheets CT-1010** and **CT-1011** contains plans and profiles for the 107th Place cross-over.

Chapter 3 Environmental Impacts and Mitigation

The Supplemental EA is being undertaken to supplement the Draft EIS, evaluating impacts from the three design changes made since the announcement of the Preferred Alignment in 2018. Two resources, Geology and Soils, and Energy, would not be affected by any of the design changes and, therefore, are not discussed in this chapter. Information that has not changed from the Draft EIS, such as methods, existing conditions, impacts, and mitigation, is not discussed. All mitigation will be carried forward from the Draft EIS unless indicated otherwise in this Supplemental EA. Only new or modified mitigation necessitated by the three design changes is disclosed in this document. Refer to the Draft EIS and the Draft EIS appendices for specific information on a resource that has not changed.

3.1 130th Street Station Relocation

This section evaluates and compares impacts resulting from the relocation of the 130th Street station to those identified in the Draft EIS when the station location was north of 130th Street. **Figure 3-1** shows the general location of the 130th Street station that was analyzed in the Draft EIS (north of 130th Street) and the general location of the 130th Street station that is subject to this Supplemental EA (south of 130th Street). **Figure 3-1** depicts the station location evaluated in the Draft EIS and the location evaluated in this Supplemental EA for comparison purposes. However, this figure does not show the exact footprints of the 130th Street station.

3.1.1 Transportation

3.1.1.1 Methods

Appendix H, *Transportation Technical Memorandum* in the Draft EIS describes the transportation framework and methodology (CTA 2016). CTA studied local resources to understand the existing transportation network and other planned projects near the RLE Project. However, since the Draft EIS, these resources now include the Chicago Metropolitan Agency for Planning's (CMAP) *ON TO 2050* comprehensive plan (CMAP 2018a), updates to the City of Chicago transportation and community-specific plans, and more recent Illinois Department of Transportation (IDOT) studies. *ON TO 2050* provides strategies and priorities for the future development of the regional transportation network.

To analyze vehicular traffic impacts resulting from the changed vehicular traffic as a result of the 130th Street station relocation, CTA conducted a detailed vehicular traffic analysis at 16 locations within the 130th Street station project area. A total of eight intersections and eight interstate ramps were analyzed. **Figure 3-2** shows the project area and the intersections and interstate ramps analyzed near the 130th Street station relocation. The project area is defined as the area within ½ mile of the station area. It was determined that vehicular traffic patterns outside of the project area would remain unchanged as a result of the 130th Street station relocation.

As in the Draft EIS, to understand the existing vehicular traffic conditions within the project area and identify peak-hour turning movements, CTA compiled existing and historic traffic count data from IDOT, CMAP, and the Chicago Department of Transportation (CDOT). In addition, CTA collected new manual traffic counts at intersections where historical data were not available. CTA compiled and reviewed the following traffic data:

- Traffic distribution and local circulation patterns
- Vehicle occupancy levels
- Road capacity levels
- Road peak-hour (AM & PM) traffic volumes
- Intersection lane geometry and traffic signal timing plans
- Planned roadway improvements

Due to the COVID-19 pandemic, travel patterns and traffic volumes were greatly altered during the analysis. As a result of CTA's coordination with IDOT, CDOT, and Cook County Department of Transportation and Highways, alternative analysis methods were identified and applied to different traffic volume groups, based on the available data.

130th Street/Ellis Avenue Intersection and 130th Street/I-94 Ramps

Historic traffic data for the 130th Street and Ellis Avenue intersection and the I-94 ramps were compared to their 2020 volume data to determine if traffic data were affected by the COVID-19 pandemic. The comparison of data determined that additional factors outside population growth impacted traffic volumes, and that the COVID-19 pandemic had affected transportation patterns. The 2020 volume data were collected on September 1 and 2, 2020 using video traffic and turning movement counts during the AM and PM periods for the 130th Street and Ellis Avenue intersection and the I-94 ramps. For comparison of the 2020 volume data, the intersection of 130th Street and Ellis Avenue used 2012 historic traffic data from the Draft EIS, whereas the I-94 ramps used a combination of 2018 and 2019 historic traffic data, based on availability from IDOT. For these two locations, the pandemic's effect on traffic has led to a reduction in traffic in the AM and a modest increase in traffic in the PM, compared to historic traffic. As a result of CTA's coordination with IDOT, it was agreed upon to use historic volumes for the 130th Street and Ellis Avenue intersection. For the I-94 ramps, per IDOT direction, the higher of the two volumes between the 2020 counts and the historic data for each ramp was chosen as the volume to be analyzed for the project.

Figure 3-2: Traffic Analysis Locations near the 130th Street Station Relocation

Altgeld Gardens Neighborhood Intersections

For these locations, 2020 traffic data were collected. Historic traffic data for these intersections were not available for comparison; therefore, a separate AM and PM growth factor of 1.93 (AM) and 0.81 (PM) was applied to the 2020 volumes of these intersections to account for the variation of transportation patterns resulting from the COVID-19 pandemic. These growth factors were calculated using the most recently available historic volumes (2012) from the neighboring intersection of 130th Street and Ellis Avenue. Historic volumes from the intersection of 130th Street and Ellis Avenue were used to calculate the growth factor, due to readily available traffic data and geographic proximity to the Altgeld Gardens neighborhood intersections.

The volumes that were established using the methods above would be considered existing condition volumes moving forward in the analysis. **Attachment C** includes a more detailed explanation of the methods used for the volumes for the Altgeld Gardens neighborhood intersections.

Existing and Future Analysis

The above data were used to calculate existing intersection level of service (LOS) using Synchro 10 and ramp LOS using Highway Capacity Software 7. **Attachment C** includes peak-hour traffic volumes used for the intersection and ramp LOS analysis.

Construction of the RLE Project is anticipated to occur from the year 2025 through 2029. Project construction is dependent on the availability of project funding and approvals. For the traffic analysis, CTA used the future year of 2050.

Data from CMAP's 2050 Regional Travel Demand model were used to develop "No Build" intersection-level traffic projections. These "no-build" traffic projections accounted for the background growth in traffic due to additional regional and subregional land use development and population growth. The background growth of traffic for roadway segments was determined by using the data from the regional travel demand model. Average annual traffic growth for roadway segments ranged from 0 to 1.1 percent.

The 2050 "No Build" traffic projections were analyzed under the No Build Alternative. To simulate the future year (2050) conditions without the RLE Project, background traffic growth between the existing year (2020) and future conditions year (2050) was grown based on a 30-year growth factor. The No Build Alternative traffic projections served as the baseline for evaluating the future "with project."

Conditions for the Preferred Alignment included the generation of park & ride and kiss & ride automobile trips to the 130th Street station. Construction of the park & ride facility at the 130th Street station would be phased starting with a total of 780 to 840 parking spaces, with the full build consisting of 1,200 parking spaces sometime in the future. This generation of automobile trips was based on the full build out of 1,200 parking spaces at the 130th Street station garage. In addition, the RLE Project is anticipated to have an impact on mode shift from vehicles to transit; the trip generation did not remove these vehicles. The trip generation analysis accounted for the full build out of the 130th Street station park & ride facility and did not account for a mode shift which provides a conservative level of analysis. The traffic analysis therefore represents the "worst-case" scenario for impact analysis.

The trip generation is based on the STOPS analysis and data from similar sized existing CTA parking facilities. STOPS is a trip modeling software used to estimate future ridership for transit projects. The software provides station mode-of-access numbers, including estimates of those driving to the new stations. These estimates feed into the traffic analysis. STOPS is used nationally and is recommended for use in trip modeling by FTA. The STOPS analysis was run for both existing year (2017), to serve as a baseline, and future year (2037) condition. The park & ride-generated trips for 2037 will be valid for 2050 because those trips are constrained by parking capacity. The Preferred Alignment generated trips were added to the No Build Alternative traffic projections to develop the total Preferred Alignment traffic volumes. The Preferred Alignment analysis uses the 2050 background No Build Alternative traffic plus the traffic generation from the 2037 STOPS analysis. The Preferred Alignment intersection LOS analyses were conducted for the study intersections.

The LOS for roadway intersections typically ranges from A to F (Transportation Research Board 2016). Appendix H, *Transportation Technical Memorandum* in the Draft EIS includes definitions of LOS A through F (CTA 2016). Essentially, A is free flow with almost no delay, while F is congested with delay impacting nearly all drivers.

The impact threshold for traffic for the Supplemental EA is a change in intersection LOS from LOS A, B, C, or D under the No Build Alternative to LOS E or F under the Build Alternative. This change in intersection LOS would result in an adverse impact. However, the Supplemental EA also includes analysis of storage capacity for turning lanes. Lanes in which storage capacity was not adequate for vehicle traffic would be considered an adverse impact. Storage capacity for turning lanes is based on red time queue formula provided in the IDOT Bureau of Design and Environment manual. At intersections where the LOS is undesirable (LOS E or LOS F) or where the existing storage length for turning lanes is insufficient based on the red time queue analysis, potential mitigation measures have been identified to offset the insufficiencies that are attributable to the RLE Project.

3.1.1.2 Existing Conditions

Because the 130th Street station area location south of 130th Street was not evaluated in the Draft EIS, the existing conditions are summarized in this section. The existing transportation environment includes public bus service, expressways, regional arterials (through roads), truck routes, intermodal connectors, secondary arterials, local streets, and pedestrian facilities. The Altgeld Gardens neighborhood, I-94, Carver Military Academy High School, the Chicago International Charter School Lloyd Bond, the George Washington Carver Primary School, Dubois Elementary School, Aldridge Elementary School, Centers for New Horizons community center, and TCA Health are within the project area. I-94 serves as the major north-south route for residents, who travel by car, to access the major employment centers in downtown Chicago.

Public Transportation

The existing public transportation systems operating within and through the project area are CTA #34 South Michigan bus route, CTA #108 Halsted/95th, and Pace #353 95th/Dan Ryan CTA - Riverdale - Homewood Limited bus route. CTA #34 enters and has stops within the Altgeld Gardens neighborhood. CTA #108 provides select stops at Carver Military Academy High School. Pace #353 is an express route that passes through the 130th Street station project area; however, it does not stop within the project area. Pace #353 travels along Indiana Avenue, 130th Street, and I-94 in the project area. The 95th/Dan Ryan station is the nearest CTA rail station to the project area (approximately 4.6 miles north) and is the southern end of the CTA Red Line. The existing public transportation systems are the same as described in Appendix H, *Transportation Technical Memorandum* in the Draft EIS (CTA 2016). Ridership values have been updated to 2019 data. The average weekday rail station entries for the 95th/Dan Ryan terminal in 2019 was 8,950 passengers (CTA 2019). **Table 3-2** shows the existing ridership data for the three bus routes located in the project area.

Table 3-2: Existing Bus Service

Bus Route Number and Name	Operating Agency	Maximum Monthly Average Weekday Ridership (September 2019)	Serves 95th/Dan Ryan Terminal
#34 South Michigan	CTA	5,045	Yes
#108 Halsted-95th	CTA	1,080	Yes
#353 95th/Dan Ryan CTA - River Oaks - Homewood Limited	Pace	1,482	Yes

Source: Regional Transportation Authority Asset Mapping and Statistics (RTAMS) 2021a, b

Notes: Service to the 95th/Dan Ryan terminal is based on route maps current as of May 2019.

Vehicular Traffic

Table 3-3 summarizes existing (historical data) traffic conditions. I-94 ramps B and C as well as ramps F and G were analyzed as weaving segments and were, therefore, analyzed as one location per ramp pair. Under existing conditions, all of the study intersections within the project area operate at LOS A or B in both the AM and PM peak periods.

Table 3-3: Existing Intersection Level of Service

ID	Intersection	Control Type	AM Peak Hour LOS	PM Peak Hour LOS[1]
1	130th Street and Ellis Avenue	Signalized	B	A
2	Old 130th Street and Ellis Avenue	Unsignalized	A	A
3	Greenwood Avenue and Ellis Avenue	Unsignalized	A	A
4	130th Place and Greenwood Avenue	Unsignalized	A	A
5	131st Street and Greenwood Avenue	Unsignalized	A	A
6	132nd Street and Greenwood Avenue	Unsignalized	A	A
7	132nd Street and Beaubien Woods Driveway	Unsignalized	A	A
8	132nd Street and Doty Avenue	Unsignalized	A	A
9	EB 130th Street and I-94 E On-Ramp (Ramp A)	Uncontrolled	A	B
10-11	EB 130th Street and I-94 E Off-Ramp (Ramp B)	Uncontrolled	B	B
	EB 130th Street and I-94 W On-Ramp (Ramp C)			
12	EB 130th Street and I-94 W Off-Ramp (Ramp D)	Uncontrolled	B	B
13	WB 130th Street and I-94 W On-Ramp (Ramp E)	Uncontrolled	A	B
14-15	WB 130th Street and I-94 W Off-Ramp (Ramp F)	Uncontrolled	B	B
	WB 130th Street and I-94 E On-Ramp (Ramp G)			
16	WB 130th Street and I-94 E Off-Ramp (Ramp H)	Uncontrolled	B	A

Notes: LOS = level of service, EB = eastbound, WB = westbound
Signalized and unsignalized intersection LOS is reported as the average delay for all movements. Uncontrolled intersection LOS is the density in the ramp influence area.
I-94 ramps B and C, as well as ramps F and G, were analyzed as weaving segments and, therefore, analyzed as one location per ramp pair.

Pedestrians

There are no sidewalks along either side of 130th Street. There are sidewalks provided along the roads in the portion of the Altgeld Gardens neighborhood that falls within the project area, with most roads having sidewalks on both sides of the road. There are no pedestrian gates along the sidewalks at the two existing Conrail at-grade roadway-railroad crossings.

Bicycle Facilities

There are no existing bicycle facilities (paths or signage) located with the project area. However, for the Forest Preserves of Cook County (FPCC) access road to the Beaubien Woods boat launch south of 132nd Street, there are bicycle symbols on the pavement for an on-road shared facility.

Chicago's bicycle sharing system, Divvy, currently has over 6,000 bicycles at over 600 stations across the city. In the summer and fall of 2020, Divvy expanded to Chicago's Far South Side. Currently there are Divvy stations within the Altgeld Gardens neighborhood located at the Altgeld Branch of the Chicago Public Library and at Golden Gate Park.

Freight Transportation

The existing freight trains that operate in the Chicago region and the freight railways that operate through the project area are the same as those described in Appendix H, *Transportation Technical Memorandum* in the Draft EIS (CTA 2016). Currently, there is a bridge crossing on 130th Street over the NICTD/CSS & SBRR tracks. In addition to that crossing, there are two at-grade crossings of a single active track located at Old 130th Street and 132nd Street found in the Altgeld Gardens neighborhood.

Parking

On-street parking is allowed on most streets of the Altgeld Gardens neighborhood. A permit or fee is not required to park on the streets. There are several existing off-street surface parking lots, but they are strictly reserved for local private residences and businesses. Many of the non-residential buildings within the Altgeld Gardens neighborhood have adequate parking available, either through on-street or parking lots associated with the buildings. TCA Health has a parking lot that has two access points to Old 130th Street adjacent to the Altgeld Gardens neighborhood.

3.1.1.3 Environmental Impacts

Permanent Impacts

Public Transportation

With the extension of the Red Line, the existing bus routes that operate within the Altgeld Gardens neighborhood would be rerouted to feed into the 130th Street station. Just over 5,900 average weekday boardings are projected for year 2037 at the 130th Street station (**Attachment C**). CTA passengers would benefit from faster travel times with access to rapid transit service farther south, compared to non-rapid transit modes (CTA and Pace buses) that are currently available in this area. CTA passengers would benefit from potential improved connections to regional commuter rail.

At the 130th Street station, buses would enter the park & ride facility, as would other vehicles, at the east side of Greenwood Avenue between 130th Place and 132nd Street across from the Altgeld Gardens parking lot. The buses would use the south driveway leading to a bus turnaround and bus bay to unload and pick up riders at the southern entrance access point. To provide service flexibility for buses, some routes may enter the station at the 132nd Street entrance and unload and pick up riders at the same bus bay. When exiting the site, all buses would exit using the park & ride facility entrance between 130th Street and 132nd Street. **Figure 3-3** shows the 130th Street station traffic circulation plan.

The following describes permanent impacts and mitigation measures to existing bus routes as a result of the relocation of the 130th Street station:

- CTA route #108 Halsted/95th would be eliminated because the addition of the rail extension would reduce the need for this express bus service.

There would be no adverse impacts on public transportation due to the relocation of the 130th Street station. No mitigation measures would be required.

Figure 3-3: 130th Street Station Traffic Circulation Plan

Vehicular Traffic

Traffic impacts would arise from changed travel patterns to reach the 130th Street station. The delay analysis includes the vehicular traffic generated by the park & ride facility as well as passenger drop-offs and pick-ups. The delay analysis is dependent upon projected traffic growth and location of the park & ride facility at the Altgeld Gardens neighborhood just south of 130th Street.

Under the No Build and Preferred Alignment conditions, no adverse LOS impacts would occur under 2050 conditions at the intersections identified in **Table 3-4**. A red time queue analysis using Build Alternative volumes was performed at 130th Street and Ellis Avenue to determine the storage lengths required for the auxiliary turn lanes. The results of this analysis determined that the eastbound right turn and westbound left turn lanes currently provide insufficient storage space to accommodate the Preferred Alignment traffic volumes in the AM peak hour. All increases in traffic volumes between the No Build and Preferred Alignment would be related to vehicle access at the park & ride facility at the 130th Street station.

Table 3-4: No Build and Preferred Alignment (2050) Intersection Level of Service

ID	Intersection	Control Type	No Build (2050)		Preferred Alignment (2050)	
			AM Peak Hour LOS[1]	PM Peak Hour LOS[1]	AM Peak Hour LOS[1]	PM Peak Hour LOS[1]
1	130th Street and Ellis Avenue	Signalized	B	B	B	C
2	Old 130th Street and Ellis Avenue	Unsignalized	A	A	A	A

8	132nd Street and Doty Avenue	Unsignalized	A	A	A	A
9	EB 130th Street and I-94 E On-Ramp (Ramp A)	Uncontrolled	A	B	A	B
10-11	EB 130th Street and I-94 E Off-Ramp (Ramp B)	Uncontrolled	B	B	B	B
	EB 130th Street and I-94 W On-Ramp (Ramp C)					

ID	Intersection	Control Type	No Build (2050)		Preferred Alignment (2050)	
			AM Peak Hour LOS[1]	PM Peak Hour LOS[1]	AM Peak Hour LOS[1]	PM Peak Hour LOS[1]
12	EB 130th Street and I-94 W Off-Ramp (Ramp D)	Uncontrolled	B	B	B	B
13	WB 130th Street and I-94 W On-Ramp (Ramp E)	Uncontrolled	B	B	B	B
14-15	WB 130th Street and I-94 W Off-Ramp (Ramp F)	Uncontrolled	C	C	C	C
	WB 130th Street and I-94 E On-Ramp (Ramp G)					
16	WB 130th Street and I-94 E Off-Ramp (Ramp H)	Uncontrolled	B	B	B	B

Notes: LOS = level of service, EB = eastbound, WB = westbound
Signalized and unsignalized intersection LOS is reported as the average delay for all movements. Uncontrolled intersection LOS is the density in the ramp influence area.
I-94 ramps B and C, as well as ramps F and G, were analyzed as weaving segments and therefore analyzed as one location per ramp pair.

Under the mitigated Preferred Alignment 2050 conditions, the intersection of 130th Street and Ellis Avenue would continue to operate with an acceptable LOS as it does in the No Build condition.

At the 130th Street station, all automobiles would enter the same entrance as the buses at the park & ride facility entrance between 130th Place and 132nd Street. Kiss & ride vehicles would use the south driveway leading to the southern entrance of the parking garage. Kiss & ride vehicles would drop off their passenger(s) and exit using the same driveway as the park & ride facility. Park & ride vehicles would enter the parking garage and park their vehicles. When it is time to leave the station, park & ride vehicles would exit on the northern end of the garage using Old 130th Street westbound and follow that to the 130th Street and Ellis Avenue intersection. Old 130th Street east of Ellis Avenue would maintain two-way access. Minimal traffic is expected to enter Old 130th Street from Ellis Avenue because southbound left turns are not a possible movement due to a barrier median on Ellis Avenue. **Figure 3-3** shows the 130th Street station traffic circulation plan.

The 130th Street station would close Old 130th Street across the new RLE tracks. Old 130th Street currently provides access to the TCA Health building and Carver Military Academy High School and would serve as the park & ride exit from the 130th Street station. Access from Old 130th Street would remain to both driveways leading to TCA Health and from 130th Place to Greenwood Avenue. Carver Military Academy High School has two existing access points: the primary inbound and outbound access from Greenwood Avenue to 132nd Street and secondary access via Doty Avenue and Old 130th Street when traveling north to/from the high school. Under the

Preferred Alignment, the secondary access via Doty Avenue would be closed, and vehicles traveling to Carver Military Academy High School would only use the primary entrance at Greenwood Avenue to 132nd Street. However, Doty Avenue can still be used for access to/from the south of the high school.

Pedestrians

The relocation of the 130th Street station south into the Altgeld Gardens neighborhood would benefit pedestrians. Although increased vehicle traffic would now enter the Altgeld Gardens neighborhood, this increased traffic would be limited to two roadways. Adjacent intersections would be upgraded with ADA-accessible curb ramps; visible crossing pavement markings would be added; and deteriorated sidewalks in the Altgeld Gardens neighborhood, adjacent to the 130th Street station, would be replaced. These improvements would provide access for all users and would improve pedestrian safety. Permanent impacts on pedestrians would not be adverse after mitigation. The relocation of the 130th Street station would be beneficial to pedestrians because it would be located adjacent to the Altgeld Gardens neighborhood and would no longer require pedestrians to cross 130th Street.

The impacts on pedestrian circulation would not be adverse due to the relocation of 130th Street station. No mitigation measures would be required.

Bicycles

The Preferred Alignment would create efficient transit connections, as well as provide potential future connections, to the RLE Project and the larger network of CTA stops and stations for bicyclists. The 130th Street station would include bicycle parking for the surrounding communities and for potential future bike facility connections to the station.

There would be no adverse impacts on bicyclists due to the relocation of the 130th Street station. No mitigation measures would be required.

Freight Transportation

A permanent impact to freight transportation that was not previously an impact in the Draft EIS is:

- Old 130th Street would be closed to through vehicle traffic just west of the existing Conrail at-grade crossing. This provides a safety benefit for freight by reducing the amount of vehicle traffic that would use the at-grade crossing.

There would be no adverse impacts on freight transportation due to the relocation of the 130th Street station because existing freight capacity would be maintained. No mitigation measures would be required.

Parking Facilities

Sufficient parking capacity would be provided at the 130th Street station to accommodate all CTA ridership traveling by vehicle within the CTA parking facilities. Existing on-street parking along the east side of Greenwood Avenue from Ellis Avenue to the proposed 130th Street station entrance would be removed to allow for CTA buses to travel on Greenwood Avenue. On-street parking along the west side of Greenwood Avenue, from Ellis Avenue to 132nd Street, and along the east side of Greenwood Avenue south of the 130th Street station entrance would remain.

Existing parking facilities at TCA Health would be affected by the relocation of the 130th Street station and would require mitigation measures. Mitigation measures would include redesign of the parking lot to maintain three entrance and exit points, and replacement of parking spaces at a minimum ratio of 1 to 1. The redesign of the parking lot would be done in coordination with TCA Health and would provide the required number of ADA parking spaces. The parking lot would also meet the City of Chicago Landscape Ordinance.

Construction Impacts

Construction associated with the 130th Street station would occur primarily on vacant land away from operating roadways. Construction of the 130th Street station access road would temporarily impact an entrance and parking spaces to TCA Health and may temporarily limit parking above and beyond the permanent number of parking spaces being displaced. However, access to TCA Health would be maintained through the duration of construction. There could be some limited increases in traffic instances in the Altgeld Gardens neighborhood due to construction equipment and material delivery. CTA would phase construction to minimize impacts on local neighborhood traffic. Outside the neighborhood, improvements at the 130th Street and Ellis Avenue intersection would involve temporary lane closures as the improvements are being constructed. Flagging operations and scheduled track closures would occur during construction activities near or adjacent to railroad tracks, as required.

3.1.1.4 Mitigation

For intersections where the existing storage length for turning lanes are insufficient based on the red time queue analysis, CTA has identified potential mitigation measures to offset the portion of the LOS deterioration attributable to the Build Alternative. These include both an operational change to signal timing in the PM peak hour under future conditions and a physical improvement to the eastbound right turn and westbound left turn storage lane to address future storage need lengths. **Table 3-5** identifies mitigation measures for the affected intersection.

Table 3-5: Mitigation Measures for the Build Alternative (2050) Conditions

ID	Intersection	Mitigation Measure
1	130th Street and Ellis Avenue	PM: Adjusted signal timing splits. AM/PM: Extended the eastbound right turn and westbound left turn storage lane.

Notes: Traffic signal timing optimization reduces travel time, reduces total system delay, and improves mobility within the urban transportation system. The need to allocate green signal time to certain legs of an intersection changes over time as traffic volumes change. Optimum allocation of the green signal time based on the volume of traffic in each direction would reduce wait times at the intersections and improve traffic flow. In a system network, optimizing the system reduces total delay along a corridor.

The intersection of 130th Street and Ellis Avenue would be improved as part of the mitigation measures for the RLE Project. The mitigation measures would improve traffic delay and create more capacity to store the increased traffic demand and prevent traffic from queuing into neighboring lanes. The signal timing adjustment would be performed by CDOT based on the updated analysis. The increases to the storage lengths would be performed as part of the CTA work to construct the 130th Street station. There would be no adverse traffic impacts from the Build Alternative, after mitigation.

Mitigation measures would be implemented to minimize impacts from the closure of the secondary access point to the Beaubien Woods Forest Preserve. These mitigation measures are listed in **Chapter 4**.

Mitigation measures for the impacts to an entrance and parking spaces to TCA Health would include redesign of the parking lot to maintain three entrance and exit points, and replacement of parking spaces at a minimum ratio of 1 to 1. The redesign of the parking lot would be done in coordination with TCA Health and would provide the required number of ADA parking spaces. The parking lot would also meet the City of Chicago Landscape Ordinance.

No adverse impacts to transportation would occur as a result of the 130th Street station relocation. The relocation of the 130th Street station would result in permanent benefits to public transportation from faster travel times and would result in benefits to bicyclists since the relocated station would provide bicycle parking for the surrounding communities and for potential future bike facility connections to the station.

3.1.2 Land Use and Economic Development

3.1.2.1 Methods

The methodology includes reviewing existing land use plans. The land use plans cited in the Draft EIS are applicable to the 130th Street station area. The following land use and economic plans are either new, have been updated, or were not referenced at the time of the Draft EIS:

- As part of the RLE Project, CTA is undertaking a *Transit-Supportive Development (TSD) Comprehensive Plan* to identify the potential for transit-oriented development (TOD) around each station area. The results of this study will guide the future land uses along the corridor and help advance the RLE Project through the FTA Capital Investment Grant New Starts Program.
- *ON TO 2050* (CMAP 2018a): The plan builds on the agency's first comprehensive regional plan, *GO TO 2040 Comprehensive Regional Plan,* and identifies three clear, overarching principles:

  1) Inclusive growth: Growing our economy through opportunity for all.
  2) Resilience: Preparing for rapid changes, both known and unknown.
  3) Prioritized Investment: Carefully targeting resources to maximize benefit.

  These principles inform every recommendation in *ON TO 2050*'s five chapters of Community, Prosperity, Environment, Governance, and Mobility. The RLE Project (i.e., RSP 57) is highlighted as a "regionally significant project" within the Mobility chapter of *ON TO 2050*.
- The *Draft Comprehensive Economic Development Strategy Report* (Cook County 2019): This report is an update to the 2009 report that was referenced in the Draft EIS. This report outlines the County's Department of Planning and Development's vision and five key focus areas, each with a policy goal and strategies for implementation. The report not only fulfills the planning requirements of the U.S. Economic Development Administration and U.S. Department of Housing and Urban Development *Planning for Progress* (Cook County 2015) but also signals a clear intent to coordinate investments across County departments to maximize their impact.
- *The Real Estate Mantra- Locate Near Public Transportation (*Center for Neighborhood Technology 2019): This report compares the performance of residential and commercial property sales near fixed-guideway stations with areas without public transit access between 2012 and 2016 in seven regions around the United States. Research results indicate that the presence of fixed-guideway public transportation (rail and bus rapid transit) has a strong correlation to higher property values.

- *A Plan for Economic Growth* (World Business Chicago 2012): This report provides a framework within which greater Chicago can define priorities and undertake an integrated and unified agenda for economic growth. The plan describes the foundations for growth that are necessary for metropolitan economies to move toward and embrace the "next economy." It also measures how well Chicago is doing in comparison with past performance, national performance, and the performance of peer regions.
- *Altgeld Gardens - Philip Murray Homes Master Plan* (CHA 2013): The Master Plan charts a course for opportunities for diverse housing options, access to jobs and training, efficient transportation infrastructure, expanded learning and recreational spaces, historic preservation, and sustainable design. The plan states that the RLE Project would provide residents with greater accessibility to jobs, retail, and services in other parts of the city.

3.1.2.2 Existing Conditions

Because the 130th Street station area location south of 130th Street was not evaluated in the Draft EIS, the existing conditions are summarized in this section. Land uses in the 130th Street station area include residential, institutional, utilities, parkland, forest preserve, industrial, commercial, and vacant. **Figure 3-4** depicts the most recent land uses available in the project area, defined as the area within ½ mile of the station area. Land uses were obtained from CMAP's 2015 Land Use Inventory (CMAP 2015), consistent with the Draft EIS.

Altgeld Gardens neighborhood, a CHA multifamily public housing neighborhood, is located to the west of the 130th Street station. While the land use for this area is classified as single-family residential (See **Figure 3-4**), Altgeld Gardens neighborhood contains 1,539 multifamily residential units in the 157-acre complex (CHA 2020). Approximately 500 units east of Greenwood Avenue were demolished in 2017, and a portion of this area is where the 130th Street station would be constructed. Although the units in the eastern end of the Altgeld Gardens neighborhood were demolished, **Figure 3-4** still shows these vacant parcels as residential since the data is from 2015.

Since the Draft EIS, the Altgeld Family Resource Center has been built in the Altgeld Gardens neighborhood at 955 E. 131st Street, west of the 130th Street station. The multiuse facility includes the Altgeld Branch of the Chicago Public Library, a childcare center, and community meeting space. TCA Health is located at 1029 E. 130th Street, also west of the 130th Street station.

Immediately east and southeast of the station is the Beaubien Woods Forest Preserve, a 279-acre preserve, containing a mix of prairie, woodland, and wetland habitats. Flatfoot Lake is also within the preserve. A trailered boat launch within the Beaubien Woods Forest Preserve provides access to the Little Calumet River for canoes, kayaks, rowboats, sailboats, and boats with trolling motors. Activities in the preserve include boating, fishing, bird watching, and picnicking. The northern end of the Beaubien Woods Forest Preserve is a linear green space that parallels the Conrail track to just south of Old 130th Street. The Beaubien Woods Forest Preserve is FPCC property. George Washington Carver Park, owned by the Chicago Park District (CPD), and George Washington Carver Primary School are located to the southwest of the station.

To the east of the linear green space that parallels the Conrail tracks is Carver Military Academy High School, a 4-year public military high school, operated by the Chicago Public Schools. Approximately 500 students attend this high school.

As discussed in the Draft EIS, to the northwest of the station is the Calumet Reclamation Plant, owned by MWRD. To the northeast is vacant railroad right-of-way property and vacant property owned by Calumet Solids Management Area. Other smaller local retailers and other types of businesses are within ½ mile of the station.

Figure 3-4: Land Uses in the 130th Street Station Project Area

Zoning

The station area falls within different zoning districts designated by the City of Chicago Zoning Ordinance as shown in **Figure 3-5**.

Zoning for the Altgeld Gardens neighborhood and Carver Military Academy High School is residential single-unit (RS-3). George Washington Carver Park and the Beaubien Woods Forest Preserve linear segment owned by FPCC that parallels the Conrail between Old 130th Street and 132nd Street are zoned Parks and Open Space District (POS-1). Zoning for TCA Health is Neighborhood Shopping District (B1-1).

There are also two parcels owned by the City of Chicago and located immediately south of 133rd Street, which are identified as residential and planned development.

The MWRD and Calumet Solids Management Area property is zoned as a manufacturing district (M3-3). In addition, a large parcel of land located in the northeast portion of the project area is zoned Planned Manufacturing District. This area is part of the Lake Calumet Area Industrial Tax Increment Financing district.

None of the zoning classifications identified in the project area have changed since the Draft EIS.

Planned Land Uses

The *Transit-Supportive Development Comprehensive Plan* that is underway will identify the potential for TOD around each station area. The land use and zoning plans and policies developed as part of this plan can be used to develop transit-supportive policies for adoption by the City. Conceptual site plans will define future land use, zoning, and urban design considerations as well as multimodal access. The results of this plan can encourage future land use development around the 130th Street station. Subsequently, it is expected that the construction of the 130th Street station would increase population, employment, and housing statistics based on increased densities from TOD.

Figure 3-5: Zoning in the 130th Street Station Project Area

3.1.2.3 Environmental Impacts

Permanent Impacts

The relocation of the 130th Street station to the south of 130th Street would be consistent with local and regional land use and economic development plans. These include the *ON TO 2050,* the *Altgeld Gardens - Philip Murray Homes Master Plan,* the *130th Street Station Market/Access Study* (CDOT 2010), and other plans and reports cited in this section or in the Draft EIS.

Impacts resulting from the 130th Street station relocation include the use of the existing TCA Health parking lot for the station access road, as further explained in **Section 3.1.3.3**. There would be an adverse impact on TCA Health since a portion of their parking lot would be used for an access road to the 130th Street station.

CHA demolished Blocks 11, 12, and 13 in the Altgeld Gardens neighborhood after publication of the Draft EIS; the area for Blocks 11 and 13, where the 130th Street station would be located, is now vacant. These vacant CHA parcels (14.5 acres total) would be acquired for the station facility and parking. A zoning change for the CHA parcels would be required for the construction of the station facility and parking. In addition, two City-owned parcels that would be used as mitigation for the FPCC impacts would require a zoning change.

The station would enhance access to the Altgeld Gardens neighborhood. It would also enhance transit access to Carver Military Academy High School and the Beaubien Woods Forest Preserve.

The closure of Old 130th Street would eliminate a connection to the access road into the Beaubien Woods Forest Preserve from Old 130th Street. The 130th Street station would impact an entrance and parking spaces to TCA Health.

The Draft EIS also discusses long-term economic benefits such as the added benefits of TOD, improved access, and travel time savings.

Construction Impacts

Construction jobs could create short-term economic benefit. Construction activities associated with the relocated 130th Street station would cause new temporary impacts to Altgeld Gardens residents, TCA Health employees and visitors, and Carver Academy students such as noise, dust, and traffic due to construction equipment and materials delivery. There would be no adverse construction impacts on land use or economic development due to the relocation of the 130th Street station.

3.1.2.4 Mitigation

Mitigation measures for impacts to an entrance and parking spaces to TCA Health would include redesign of the parking lot to maintain three entrances and exit points and replacement of impacted parking spaces at a minimum ratio of 1 to 1. The redesign of the parking lot would provide the required number of ADA parking spaces and would also meet the City of Chicago Landscape Ordinance. The temporary displacement of parking during construction would be mitigated by existing on-street parking along Old 130th Street and Greenwood Avenue. CTA would coordinate construction of the parking lot redesign with TCA Health.

CTA would work with the City of Chicago to modify the zoning for the station and the two parcels owned by the City of Chicago currently zoned as residential and planned development that would be used as mitigation for the FPCC impacts.

After mitigation measures, there would be no adverse impacts to land use and economic development due to the relocation of the 130th Street station.

3.1.3 Displacements and Relocations of Existing Uses

3.1.3.1 Methods

The regulatory framework directing the displacements and relocations of existing uses analysis and the methodology have not changed since the Draft EIS.

3.1.3.2 Existing Conditions

The area for CHA Blocks 11 and 13, where the 130th Street station would be located, is vacant. The 130th Street station is surrounded by several different land uses, as discussed in **Section 3.1.2**. There are also multiple community resources and land uses in the area, such as a library, two schools, and Beaubien Woods Forest Preserve.

3.1.3.3 Environmental Impacts

Permanent Impacts

Permanent impacts would occur on parcels acquired for construction of the RLE Project. The relocated 130th Street station would be built on vacant land. No buildings would be displaced or relocated. However, the 130th Street station would impact parking spaces to TCA Health. Mitigation measures would be required.

As shown in **Figure 3-6**, four parcels would need to be acquired for the construction of the relocated 130th Street station. Construction of the station would directly impact Parcels #1 and 2.

Parcels #3 and 4, located south of 133rd Street, would be acquired for FPCC impact mitigation. **Table 3-6** lists these parcels, which are depicted in **Figure 3-6**.

Mitigation measures would be required for the property acquisitions.

Table 3-6: Parcels to Be Acquired for the 130th Street Station Relocation

Parcel ID in Figure 3-6	PIN	Address	Type	Existing Land Use	Future Land Use
1	25-35-100-021	1029 E. 130th Street	Partial Acquisition	Commercial	Right-of-way
2	25-35-100-020	969 E. 130th Street	Partial Acquisition	Vacant	Station and parking
3	25-35-100-016	1108 E. 133rd Street	Full Acquisition	Vacant	Forest preserve
4	25-35-100-010	500 E. 134th Street	Full Acquisition	Vacant	Forest preserve

Construction Impacts

Construction would occur on Parcels #1 and 2 listed in **Table 3-6**. Construction of the 130th Street station access road would temporarily impact parking at TCA Health.

3.1.3.4 Mitigation

CTA would work with the property owners to acquire the parcels needed for the 130th Street station relocation. The Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Uniform Act) would be followed. Mitigation measures for impacts to an entrance and parking spaces to TCA Health would include redesign of the parking lot to maintain three entrances and exit points and replacement of impacted parking spaces at a minimum ratio of 1 to 1. The redesign of the parking lot would provide the required number of ADA parking spaces. The parking lot would also meet the City of Chicago Landscape Ordinance. The temporary displacement of parking during construction would be mitigated by existing on-street parking along Old 130th Street and Greenwood Avenue. CTA would coordinate construction of the parking lot redesign with TCA Health.

Mitigation measures for the Beaubien Woods Forest Preserve are discussed in **Chapter 4**.

There would be no adverse impacts on displacements due to the relocation of the 130th Street station after mitigation.

Figure 3-6: Displacements in the 130th Street Station Project Area

3.1.4 Neighborhoods and Communities

3.1.4.1 Methods

The methodology used to determine neighborhood and community impacts follows the *Community Impact Assessment: A Quick Reference for Transportation* (U.S. Department of Transportation [USDOT] 2018), which is an update to the 2008 report that was used in the Draft EIS.

The project area is defined as the area within ½ mile of the station area. Three community areas are within the project area for the 130th Street station relocation: Riverdale, South Deering, and Hegewisch. The portion of South Deering and Hegewisch within the project area is mainly NICTD/CSS & SBRR or I-94 right-of-way (i.e., there is no population). Therefore, South Deering and Hegewisch are not analyzed in the Neighborhoods and Communities section. This section uses 2018 5-Year American Community Survey (ACS) data from the U.S. Census Bureau.

3.1.4.2 Existing Conditions

Because the 130th Street station south of 130th Street was not evaluated in the Draft EIS, the existing conditions are summarized in this section. The station relocation would be located in the Riverdale community area. **Figure 3-7** depicts the community areas located in the 130th Street station project area.

Since the publication of the Draft EIS, there have been changes within the Altgeld Gardens neighborhood. Approximately 500 units were demolished in 2017, and the land is currently vacant. The remaining units in the neighborhood have been renovated since the Draft EIS was published.

The demographic characteristics in the project area are described below:

- The project area for the 130th Street station relocation contains 2,553 residents and 831 households. Different portions of the Riverdale neighborhood were evaluated in the Draft EIS so a direct comparison could not be made with this project area.
- Ethnicity in the project area is predominantly Black or African American (96.8 percent), with the next largest percentage (1.9 percent) being Hispanic. The Draft EIS also identified Black or African American to be the predominant ethnicity.
- The population is predominantly English-speaking.

Figure 3-7: Community Areas within the 130th Street Station Project Area

Community Resources

There has been no change in the community resources including parks and recreational facilities and other community resources since the Draft EIS. However, the station location on the south side of 130th Street is now closer to some of these resources. The 130th Street station is closer to the Beaubien Woods Forest Preserve and George Washington Carver Park, a 19-acre park that offers a swimming pool and indoor and outdoor recreational facilities.

The 130th Street station is also located closer to Carver Military Academy High School, a high school that draws students from outside the immediate neighborhood. The station is also closer to the Chicago Youth Center, a social service facility with learning, afterschool, and summer programs for children aged 15 months to 18 years old. The Altgeld Family Resource Center is in the Altgeld Gardens neighborhood and includes the Altgeld Branch of the Chicago Public Library, a childcare center, and community meeting space. TCA Health provides primary care, dental care, and behavioral health care services. Other community centers present in the project area include day cares, nutrition assistance centers, and tutoring/mentoring program sites, such as By the Hand Club.

3.1.4.3 Environmental Impacts

Permanent Impacts

Environmental impacts analyzed include changes to community character and cohesion, community resources, and mobility.

Character and Cohesion

The relocated 130th Street station would become a focal point for the surrounding communities, creating pedestrian and transit connections. It would potentially attract new commercial and residential activities that would result in an overall improvement in community character. The relocated 130th Street station would also provide a greater benefit to community character because of its proximity to communities. The relocated 130th Street station would not impose any segmentation or division of the community nor reduce its desirability to current or future residents; therefore, it would not impact cohesion.

Overall, the relocated station would enhance community character. However, there would be new visual impacts to the Altgeld Gardens residents resulting from the relocation of the 130th Street station, as discussed in **Section 3.1.5.**

There would be no adverse impact on community character and cohesion, with the exception of visual impacts due to the relocation of the 130th Street station. **Section 3.1.5** describes the adverse visual impacts that would remain after mitigation.

Community Resources

The 130th Street station would impact an entrance and parking spaces to TCA Health.

Mobility

The relocation of the 130th Street station would increase overall mobility for Riverdale residents; this has not changed since the Draft EIS. The closure of Old 130th Street would eliminate one of three access routes to the Carver Military Academy High School. Closure of this route would not result in an adverse impact because the primary access to the school is from 130th Street to Ellis Avenue to Greenwood Avenue to 132nd Street. The secondary access from Doty Avenue from the south would remain unchanged, as discussed in **Section 3.1.1**. This change in access to the high school is not considered an adverse impact since two access points would remain. No mitigation measures would be required.

The closure of Old 130th Street would eliminate a connection to the access road into the Beaubien Woods Forest Preserve from Old 130th Street. Closure of this connection would not result in an adverse impact because the primary access to Beaubien Woods Forest Preserve is from Ellis Avenue to Greenwood Avenue to 132nd Street.

Construction Impacts

Neighborhoods and community resources would be accessible during construction of the 130th Street station. Construction of the 130th Street station access road would impact an entrance and parking spaces to TCA Health and may temporarily limit parking above and beyond the permanent number of parking spaces being displaced.

3.1.4.4 Mitigation

Mitigation measures for impacts to an entrance and parking spaces to TCA Health would include redesign of the parking lot to maintain three entrances and exit points and replacement of impacted parking spaces at a minimum ratio of 1 to 1. The redesign of the parking lot would provide the required number of ADA parking spaces. The parking lot would also meet the City of Chicago Landscape Ordinance. The temporary displacement of parking during construction would be mitigated by existing on-street parking along Old 130th Street and Greenwood Avenue. CTA would coordinate construction of the parking lot redesign with TCA Health.

There would be no adverse impacts on Neighborhoods and Communities due to the relocation of the 130th Street station with the exception of visual impacts after mitigation. **Section 3.1.5.3** discusses mitigation measures to minimize visual impacts.

3.1.5 Visual and Aesthetic Conditions

3.1.5.1 Methods

The regulatory framework directing the visual and aesthetic conditions analysis and the methodology have not changed since the Draft EIS.

3.1.5.2 Existing Conditions

Existing viewsheds of the 130th Street station relocation area from the Altgeld Gardens neighborhood and Carver Military Academy High School include vacant, vegetated areas. The Altgeld Gardens neighborhood consists of two-story buildings with 1,539 multifamily residential units. Residential units along Greenwood Avenue face Greenwood Avenue.

3.1.5.3 Environmental Impacts

Permanent Impacts

The visual environment that would be impacted by the 130th Street station relocation includes areas that would have a view of the new facilities and areas visible from the new facilities. Impacts could include shadows from the structures, vegetation removal, and change in visual setting for the residential neighborhood.

Because the relocated 130th Street station would comprise a four-level park & ride facility, other structures, and station, there would be high and adverse visual impacts due to the relocation of the 130th Street station. This is a change from the Draft EIS. **Photograph 3-1** shows existing conditions and a photo simulation of the 130th Street station facing east from Greenwood Avenue and just north of 132nd Street. The existing view in **Photograph 3-1** is from the eastern edge of the Altgeld Gardens neighborhood. The residential character and scale would be substantially altered by the removal of vegetation and the addition of the park & ride facility, other structures, and station for the residences that front on Greenwood Avenue. The visual impacts decrease the farther west a residential unit is within the Altgeld Gardens neighborhood. **Photograph 3-2** shows the existing conditions and photo simulation of the 130th Street station deeper within the neighborhood. **Photograph 3-3** shows the existing conditions and photo simulation of the 130th Street station from the east along the access road in Beaubien Woods Forest Preserve. Note that appearance of project elements and residences in visualizations in **Photographs 3-1**, **3-2**, and **3-3** is intended to show the scale of project elements. Actual construction appearance may differ based on design decisions for colors, textures, finishes, and choice of specific design features.

Photograph 3-3: Photo of Existing Conditions and Photo Simulation of the 130th Street Station Facing Southwest from Beaubien Woods Forest Preserve

The National Environmental Policy Act of 1969 (NEPA) visual impact assessment of a proposed undertaking includes consideration of scenic resources and scenic experiences of the people who view the landscape. Impacts include any modification of landforms or introduction of structures or other visual elements that negatively or positively affect the visual character of the landscape and the visual experience of persons viewing the landscape. Therefore, as discussed in **Section 3.1.7.1**, the NEPA visual impact assessment for a project may result in impacts and require mitigation while historic resources that fall under Section 106 for the same project may find no adverse effect on historic properties due to visual impacts if they do not alter the characteristics which qualify the property for inclusion in the National Register of Historic Places (NRHP).

Because the visual changes associated with the 130th Street station relocation would not cause the buildings at the NRHP-eligible Altgeld Gardens – Philip Murray Homes National Register Historic District to be no longer eligible for the NRHP, visual effects on historic properties would not be considered adverse, pursuant to 36 Code of Federal Regulations (CFR) § 800.5, in the 130th Street station area.

There would be high and adverse visual impacts on residents that front Greenwood Avenue due to the relocation of the 130th Street station. Mitigation measures would be required.

Construction Impacts

Construction impacts from the 130th Street station relocation on visual and aesthetic conditions would not be adverse. Temporary construction-related visual impacts would include construction fencing to secure the construction zone and to provide visual screening. Construction equipment and laydown areas will be contained within the fencing. Construction signage identifying the construction zone and warnings of any street closures will be in visible areas. There may be temporary street closures and temporary lighting near the construction zone. There would be no new construction impacts on visual and aesthetic conditions due to the relocation of the 130th Street station. No mitigation measures would be required.

3.1.5.4 Mitigation

Mitigation measures proposed at the 130th Street station relocation would include landscaping using urban design techniques to reduce massing and creating pedestrian-friendly surroundings. Since views would be permanently altered, impacts on visual and aesthetic conditions would remain high and adverse after mitigation.

3.1.6 Noise and Vibration

3.1.6.1 Methods

For the Supplemental EA, noise and vibration impact assessment at sensitive receivers in the vicinity of the relocated 130th Street station was carried out in accordance with the guidelines specified in FTA *Transit Noise and Vibration Impact Assessment Manual* (FTA 2018). For the noise assessment, the FTA methodology for a detailed noise analysis was used. However, an analysis was not required for vibration because the nearest sensitive receivers are well beyond the FTA screening distances for vibration impact.

The noise assessment assumed that rail operations along the RLE would consist of electric-powered train types similar to those that currently operate along the Red Line corridor. In the vicinity of the 130th Street station, it was assumed that the trains would operate at grade on ballast-and-tie track with continuous welded rail. In addition, the noise predictions were based on hourly train volumes and consists (i.e., the number of cars per train) along with train speed profiles (i.e., speeds by location along the corridor) provided by CTA. The predicted noise exposure levels were adjusted for distance to nearby sensitive receivers using FTA methodology and then compared to the existing noise exposure levels at these receivers to assess noise impact based on FTA criteria. The FTA noise impact criteria are described in detail in Appendix O, *Noise and Vibration Technical Memorandum* in the Draft EIS (CTA 2016).

3.1.6.2 Existing Conditions

The existing noise conditions in the proximity of the 130th Street station were characterized based on noise measurements conducted for the Final EIS at representative sensitive receivers in September 2020. These included a long-term (24-hour) measurement of noise exposure at a sensitive receiver within Altgeld Gardens and a short-term (one-hour) measurement of noise exposure at the Carver Military Academy High School.

The results of the measurement at By the Hand Club within the Altgeld Gardens neighborhood indicated an existing day/night sound level (L_{dn}) of 61 A-weighted decibels (dBA) and an existing peak-hour equivalent sound level (L_{eq}) of 56 dBA in this area. These results are also representative of the existing noise exposure levels in the Altgeld Gardens neighborhood. The results of the measurement at the high school indicated an existing peak-hour L_{eq} of 59 dBA.

3.1.6.3 Environmental Impacts

Permanent Impacts

Noise impact from future train operations was assessed at four representative sensitive receiver locations near the relocated 130th Street station. These locations, denoted as sites N-1 through N-4 in **Figure 3-8**, include TCA Health, By the Hand Club, the closest residential buildings to the RLE Project in Altgeld Gardens, and the Carver Military Academy High School. However, noise impact was not assessed at the linear green space (FPCC parcel) located to the east of the station. Because this parcel consists of open space without specific locations (e.g., benches or monuments) primarily used for passive recreation (e.g., reading, conversation or meditation), this land would not be considered noise sensitive based on FTA guidance. Because TCA Health is considered an FTA Category 3 (institutional) receiver with no noise-sensitive outdoor uses, a noise impact was not assessed for station and bus operations at this location. No other noise-sensitive receivers are located within the applicable FTA noise impact screening distances (i.e., unobstructed distances of 200 feet from rail rapid transit stations, 100 feet from access roads to stations, and 225 feet from transit centers and park & ride lots with buses).

The noise impact assessment is summarized in **Table 3-7**, which presents results for FTA Category 2 (residential) receivers with both daytime and nighttime sensitivity to noise, and for FTA Category 3 (institutional) receivers with primarily daytime and evening use. In addition to the distances to the track and proposed train speeds, **Table 3-7** presents the existing noise levels, the projected noise levels from CTA rail operations, and the applicable FTA criteria for moderate and severe noise impact. Impacts from the proposed train operations at sensitive receivers in the vicinity of the relocated 130th Street station were determined based on a comparison of the predicted project noise levels with the impact criteria.

There would be no noise impacts. No mitigation measures would be required.

Table 3-7: Summary of Noise Impacts in the 130th Street Station Relocation Area

Noise-Sensitive Receiver		FTA Land Use Category	Distance from Proposed RLE near Track (feet)	Train Speed (mph)	Existing Noise Level[1]	Project Noise Level[1]			Level of Impact
No.	Description					Predicted	Impact Criteria		
							Moderate	Severe	
N-1	TCA Health	3	372	52	56	55	61	67	None
N-2	By the Hand Club[2]	3	631	51	56	46	61	67	None
N-3	Altgeld Gardens Residence	2	460	42	61	54	58	64	None
N-4	Carver Military Academy High School[2]	3	802	15	59	43	62	68	None

Source: CTA 2021a

[1] Noise levels are measured in dBA (rounded to the nearest decibel) and are based on L_{dn} for FTA Land Use Category 2 receivers and on one-hour L_{eq} for FTA Land Use Category 3 receivers.

[2] Noise measurement location

The closest sensitive receivers are well beyond the applicable FTA vibration impact screening distances from the RLE Project right-of-way or property line for rail rapid transit projects, which are 200 feet for FTA Category 2 (residential) receivers and 120 feet for FTA Category 3 (institutional) receivers. No vibration impacts were identified in the Draft EIS, and no new impacts are anticipated due to the 130th Street station relocation.

Construction Impacts

Construction activities in the 130th Street station relocation area would include construction of at-grade track as well as park & ride facility, other structures, and station. As determined in the Draft EIS, these construction activities could result in noise impact at sensitive receivers if they occur within distances of 50 feet during daytime hours and 150 feet during nighttime hours. For vibration, it was determined that most construction equipment can be operated without risk of damage at distances of 15 feet or greater from buildings. Because sensitive receivers are located well beyond these distances, construction noise and vibration levels would not exceed FTA-recommended limits in the vicinity of the 130th Street station relocation. Therefore, there would not be noise or vibration impacts from construction; this has not changed from the Draft EIS.

There would be no new construction noise or vibration impacts due to the relocation of the 130th Street station.

3.1.6.4 Mitigation

Because there would be no noise or vibration impacts from the 130th Street station relocation, mitigation measures would not be required. Construction best management practices (BMPs) to reduce noise and vibration are described in the Draft EIS. A noise analysis for bus operations would be conducted for sensitive receivers within the FTA noise impact screening distances after the station design and detailed bus service plans for the 130th Street station have been further developed. A commitment to conduct the noise analysis from bus operations would be included in the contract documents requiring the analysis during final design.

3.1.7 Historic and Cultural Resources

This section summarizes findings under Section 106 of the National Historic Preservation Act (NHPA, 54 USC § 300101 et seq.: Historic Preservation) and in coordination with the Illinois State Historic Preservation Office (SHPO) and consulting parties to the Section 106 process.

3.1.7.1 Methods

An Area of Potential Effect (APE) for the RLE Project was established as part of the Draft EIS and further analyzed for updates due to the proposed relocation of the 130th Street station. To identify potential updates to the APE, cultural resource specialists, qualified per the Secretary of the Interior's standards, reviewed the 130th Street station area. CTA undertook field surveys to confirm conditions and develop an expanded APE.

Background research was conducted to identify previously documented historic properties within the expanded APE, which is defined in the Existing Conditions section. CTA developed an extensive historic context for the Draft EIS, which was determined sufficient to evaluate resources within the expanded APE.

After the development of the expanded APE, CTA conducted additional field surveys of historic-age properties within the expanded APE. All newly surveyed historic resources were documented with photographs of their exteriors from the public right-of-way. CTA conducted additional archival research for each to evaluate potential historic significance and level of integrity.

On June 15 and 16, 2020, CTA conducted a Phase I Archaeological Reconnaissance Survey for the 130th Street station area. The surveyed area was defined by the area on which the RLE Project has potential for direct physical impacts. The primary method of investigation was photographic recordation followed up with shovel test probes (STP) in surveyable areas. Shovel tests were excavated as specified by the SHPO. STPs are small subsurface sampling units approximately 14 inches in diameter and 14 to 20 inches deep that are excavated at 50-foot intervals across the project area. Soils from the probes were screened through ¼-inch hardware cloth. In addition to field investigation, CTA conducted research to identify the prehistoric context for the area and to identify prehistoric Native American sites recorded within 1 mile of the RLE Project.

On February 12, 2021, the draft RLE *Section 106 Eligibility Report* was submitted to the SHPO and consulting parties for review. This report included updates to the APE, historic property identification, eligibility recommendations, and archeological methods and conclusions for the full Preferred Alignment.

On February 18, 2021, CTA conducted the first consulting party meeting for the RLE Project since selection of the Preferred Alignment. This meeting included a summary of the RLE Project and Section 106 activities conducted to date. Review and discussion focused on areas of APE expansion due to changes since the last Section 106 consultation meeting, corresponding historic property identification, and eligibility recommendations. A 30-day comment period (from February 16 to March 12, 2021) was established to take consulting party and SHPO comments on eligibility findings. Comments received confirmed findings of the eligibility assessment and SHPO provided their concurrence on eligibility findings on March 18, 2021. The *Section 106 Eligibility Report* was approved by the FTA on June 8, 2021. This report is included in **Attachment D.**

On June 11, 2021, the draft RLE *Section 106 Effects Report* was submitted to SHPO and consulting parties for review. This report included updates to the effects recommendations from the Draft EIS and effects recommendations for historic properties within the expanded APE. A Section 106 consulting party meeting was held on June 30, 2021 to review findings of the effects assessment on eligible historic and cultural resources and obtain additional consulting party input. A 30-day comment period, from June 11 to July 9, 2021 was established to take comments from consulting parties on effects determinations. Comments received from consulting parties confirmed these effects findings. In order to address SHPO's response to the draft *Section 106 Effects Report*, an additional breakout meeting was held between CTA, FTA, and SHPO on July 26, 2021. As a result, on August 10, 2021, SHPO provided parameters for a finding of no adverse effect. The *Section 106 Final Effects Report* was revised to incorporate this changed information and was distributed to consulting parties for a final review and comment from September 13 to September 27, 2021. No comments were received during this time. The *Section 106 Eligibility Report* and *Section 106 Final Effects Report* and comments received are located in **Attachment D**.

3.1.7.2 Existing Conditions

Following relocation of the 130th Street station south of 130th Street, the Draft EIS APE was expanded to include the full site under consideration for construction and an approximate buffer of a ¼ mile, except at visual obstructions, where it is slightly truncated. This area is based on building density, height of the proposed work, and visual observations on site, intended to encompass changes in traffic, noise, and vibration caused by the RLE Project. See **Figure 3-9.**

At the 130th Street station area, 59 previously identified historic properties and one NRHP-eligible historic district were recorded within the APE. All 59 of the individual historic properties are contributing to the Altgeld Gardens – Philip Murray Homes National Register Historic District. As discussed previously in this Supplemental EA, CHA demolished Blocks 11, 12, and 13 of Altgeld Gardens in 2017, after publication of the Draft EIS; the demolition was independent and unrelated to the RLE Project. The Section 106 process associated with the demolition of Blocks 11, 12, and 13 was carried out by CHA. While the Altgeld Gardens – Philip Murray Homes National Register Historic District was determined by the SHPO as eligible under Criteria A, B, and C, the historic district nomination process is not complete. This nomination is being prepared by CHA and reviewed by the SHPO and the National Park Service. The proposed boundary, as currently shown in **Figure 3-9**, is what is proposed in the draft historic district nomination being undertaken by CHA. The final boundary will be confirmed with CHA and SHPO for inclusion in the Final EIS.

One new historic-age resource was identified within the expanded APE for the 130th Street station relocation: Carver Military Academy High School, located at 13100 S. Doty Avenue. Because the building retains excellent architectural integrity, is a good example of Late Modernist design and associated with architect John Moutoussamy, this property is recommended individually eligible for the NRHP listing under Criterion C for architecture. Per SHPO correspondence on July 9, 2021, this property is also NRHP-eligible under Criterion A at the local level of significance.

All 60 of the individual historic properties, including Carver Military Academy High School, and the historic district are listed in **Table 3-8**. NRHP status of these historic properties, except for #7 and #8, was confirmed with consulting parties and SHPO on March 18, 2021. Since that time, properties #7 and #8 have been added to the list. These refinements were submitted with the draft *Section 106 Effects Report* and confirmed by consulting parties and SHPO on July 9, 2021.

Drexel Avenue, 13053 S. Drexel Avenue, 13065 S. Drexel Avenue, 900 E. 131st Street, 901 E. 131st Street, 13100 S. Ingleside Avenue.

3.1.7.3 Environmental Impacts

The NHPA implementing regulations establish criteria to evaluate whether an undertaking would have an adverse effect on historic properties. An adverse effect occurs when an undertaking "may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association" (36 CFR § 800.5(a)). Therefore, an adverse effect finding would be applied to any historic property that would be subject to one or more of the following criteria listed below but not limited to (36 CFR § 800.5(a)(2)):

- Physical destruction or damage to all or part of the historic property.
- Alteration that is inconsistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties.
- Removal of the property from its historic location.
- Introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant features.
- Change to the character of the property's use or the physical features within the property's setting that contribute to its significance.
- Neglect of a property that causes deterioration.
- Transfer, lease, or sale of property out of federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation.

Effects can be direct, indirect, or cumulative. If an adverse effect is found, FTA must consult with the SHPO and other consulting parties to develop and evaluate alternatives or modifications to the undertaking that could avoid, minimize, or mitigate adverse effects on the historic property (36 CFR §800.6(a)).

Under NEPA, visual impact assessment of a proposed undertaking includes consideration of scenic resources and scenic experiences of the people who view the landscape (Sullivan et al. 2018). Impacts include any modification of landforms or introduction of structures or other visual elements that negatively or positively affect the visual character of the landscape and the visual experience of persons viewing the landscape (Sullivan et al. 2018). Therefore, the NEPA visual impact assessment for a project may result in impacts and require mitigation while Section 106 for the same project may find no adverse effect on historic properties due to visual impacts if they do not alter the characteristics which qualify the property for inclusion in the NRHP.

Per **Section 3.1.6.3**, there would be no new construction noise or vibration impacts due to the relocation of the 130th Street station, and therefore, no historic properties would be affected by noise or vibration related to the project.

The RLE Project proposes no physical changes to geometry or location of streets that are within the Altgeld Gardens-Philip Murray Homes Historic District, and the RLE Project has been designed to minimize the increase in traffic on roads within the historic district. Per **Section 3.1.1.3**, the impacts on vehicular and pedestrian circulation would not be adverse due to the relocation of the 130th Street station. As illustrated in **Figure 3-3**, the only roadways within the historic district that overlap the proposed circulation are Ellis Avenue from 130th Street to Greenwood Avenue and the block of Greenwood Avenue between Ellis Avenue and 130th Place, which front only commercial properties, i.e., TCA Health and By the Hand Club.

Also described in **Section 3.1.1.3**, the 130th Street station would close Old 130th Street at the new RLE tracks. The outbound high school access from Doty Avenue and Old 130th would no longer be available. Vehicles traveling to Carver Military Academy High School would use the current primary entrance from 130th Street to Greenwood Avenue to 132nd Street or the secondary access from Doty Avenue. This would increase traffic along the current primary entrance which falls within the Altgeld Gardens-Philip Murray Homes Historic District but does not rise to the level of an adverse effect.

In order to accommodate design flexibility for the planned relocated 130th Street station, SHPO has defined parameters for a finding of no adverse effect. As stated in a letter provided by SHPO on August 10, 2021, these parameters include:

- A parking garage of 4-stories or less.
- An option to use the existing 130th Place as the station entrance; SHPO accepts this option would eliminate on-street parking on Greenwood Avenue for one block between Ellis Avenue and 130th Place.
- An option to place the entrance to the station between 130th Place and 132nd Street into the original parking lot in Block 11; doing so would result in the elimination of two blocks of historically appropriate on-street parking along the east side of Greenwood Avenue and bring traffic deeper (farther south) into AGPMH. SHPO would accept this option as meeting the Secretary of the Interior's Standards and not adversely affecting AGPMH if residents of AGPMH are also in favor.

These design parameters were the result of a meeting between FTA, CTA, and SHPO on July 26, 2021. The meeting presentation, additional renderings, meeting minutes, and SHPO review letter are included in **Attachment D**. Following these parameters, the project would have no adverse effect on the historic district or any of its contributing properties.

A summary of effects for all historic properties in the RLE Project APE can be found in **Table 3-9**.

Table 3-9: Summary of Effects on Historic Properties

Map ID	Address	Description	Assessment of Effect
1	13100 S. Doty Avenue	Carver Military Academy	No Adverse Effect
2	Varies	53 Residences Contributing to AGPMH	No Adverse Effect
3	13015 S. Ellis Avenue	By the Hand Club, included in AGPMH Historic District	No Adverse Effect
4	13100 S. Ellis Avenue	Grocery/Retail Building, included in AGPMH Historic District	No Adverse Effect
5	940 E. 132nd Street	Administration/Maintenance Building, included in AGPMH Historic District	No Adverse Effect
6	975 E. 132nd Street	CYC - Dorothy Gautreaux Child Development Center, included in AGPMH Historic District	No Adverse Effect
7	941 E. 132nd Street	Children’s Building	No Adverse Effect
8	951 E. 132nd Place	Altgeld Gardens Community Building No. 2	No Adverse Effect
9	Multiple (Public Housing Project)	Altgeld Gardens-Philip Murray Homes Historic District	No Adverse Effect

Source: CTA 2021c

Based on eligibility and effects findings and Section 106 consultation, the RLE Project would result in no adverse effects to historic properties. There would be no direct or indirect effects on historic properties as a result of the 130th Street station relocation. On August 10, 2021, SHPO provided parameters for a finding of no adverse effect. The *Section 106 Final Effects Report* was revised to incorporate this changed information and distributed to consulting parties for final review and comment from September 13 to September 27, 2021. No comments were received during this time.

3.1.7.4 Mitigation

Because there would be no adverse effects to historic properties from the 130th Street station relocation, mitigation would not be required.

3.1.8 Hazardous Materials

3.1.8.1 Methods

CTA conducted a Phase I Environmental Site Assessment (ESA) for the Preferred Alignment. The site reconnaissance, as part of the Phase I ESA, was conducted from June 8 to June 10, 2020. The Phase I ESA was performed in order to satisfy the requirements of FTA through Standard Operating Procedure 19. A copy of the *Corridor Level Phase I Environmental Site Assessment Report* (the Phase I ESA) (Environmental Design International Inc. 2020) is provided in **Attachment E**.

The Phase I ESA generally followed the American Society for Testing and Materials International Standard E1527-13, Standard Practice for Environmental Site Assessments (the Practice). Limitations and exceptions from the Practice are defined as data gaps. The Practice defines data gaps as a lack of, or inability to obtain, required information despite good faith efforts of the environmental professional. The Practice requires the environmental professional to comment on the impact of significant data gaps on their ability to identify Recognized Environmental Conditions (RECs). Data gaps identified in the Phase I ESA were determined not significant. The data gaps are presented in the Phase I ESA. The goal of the Practice is to identify RECs in connection with the RLE Preferred Alignment. The purpose of the Practice is to define good commercial and customary processes for conducting a Phase I ESA. Because the Phase I ESA was conducted on the Preferred Alignment, a summary of the Phase I ESA that pertains to the 130th Street station relocation area is described below.

3.1.8.2 Existing Conditions

The location of the 130th Street station contains a grassy, vacant lot identified as Altgeld Gardens Blocks 11 and 13. The surrounding land uses consist of residential properties associated with the Altgeld Gardens neighborhood to the west, Beaubien Woods Forest Preserve, a single set of railroad tracks followed by Doty Avenue and the Carver Military Academy High School to the east, TCA Health, portions of Old 130th Street followed by vacant land and 130th Street to the north, and portions of 132nd Street followed by the Beaubien Woods Forest Preserve to the south.

The *Corridor Level Phase I Environmental Site Assessment Report* (Environmental Design International Inc. 2020) included an environmental database review for the 130th Street station relocation site. As part of the Phase I ESA, documents provided by CHA for Blocks, 11, 12, and 13 were reviewed. CHA conducted a Phase II ESA on Blocks 11, 12, and 13, which involved the collection of soil samples for environmental analysis. The Phase II ESA resulted in no further investigation. No RECs were identified at the proposed station. However, the following off-site REC was identified east of the proposed station:

- Railroad tracks – Railroad tracks were observed adjacent to the Beaubien Woods Forest Preserve, approximately 270-350 feet east of the 130th Street station relocation. These tracks exist at various locations on elevated embankments. The source of the fill material used to make the embankments is unknown. This rail line was also used to transport freight, which may include hazardous materials or petroleum products. Spills or releases that occurred on or along this track may have impacted soils. Furthermore, releases may have occurred from creosote-treated railroad ties or coal ash releases from historic steam train operations.

3.1.8.3 Environmental Impacts

Permanent Impacts

The off-site REC, Conrail tracks east of the 130th Street station relocation, would be a potential impact related to hazardous materials. The Conrail tracks were not considered an off-site REC in the Draft EIS. However, the potential for hazardous material impacts from other adjacent freight railroads were considered in the Draft EIS. Previously identified concerns and impacts regarding adjacent freight railroads would be the same as presented in the Draft EIS.

The 130th Street station relocation would have no new adverse impacts due to hazardous materials.

Construction Impacts

Adverse construction impacts from the 130th Street station relocation are the same as those described in the Draft EIS. There would be no new adverse construction impacts due to hazardous materials.

3.1.8.4 Mitigation

Mitigation measures proposed at the 130th Street station relocation are the same as those described in the Draft EIS, with a commitment to conduct limited subsurface investigations where earthmoving activities would occur. These investigations would include characterization and evaluation of soils to inform handling, suitability for possible re-use within the project area, and potential disposal options.

There would be no adverse impacts due to hazardous materials after mitigation.

3.1.9 Wetlands

3.1.9.1 Methods

A desktop review was conducted of information collected for the Draft EIS in comparison with the project area for the 130th Street station relocation and updated database information. Resources reviewed included the 2015 Wetland Delineation Report prepared as part of the Draft EIS, the U.S. Fish and Wildlife Service (USFWS) National Wetlands Inventory (NWI), the Natural Resources Conservation Service (NRCS) Web Soil Survey, and updated aerial imagery. The 2015 Wetland Delineation Report included a small area of overlap of the 130th Street station area. CTA conducted a field “windshield” reconnaissance on October 17, 2020, which included presence/absence confirmation of wetland areas. The “windshield” reconnaissance was limited to a drive-by review of those resources that are readily publicly accessible to corroborate information reviewed during desktop analysis. The area reviewed included the publicly accessible roads in the project area and the landscape clearly visible from those spaces. Because the 2015 Wetland Delineation Report expired in June 2021, a new wetland delineation would be conducted to evaluate the field conditions in the project area, if required for permitting or coordination. A site review meeting was held with a representative of U.S. Army Corps of Engineers (USACE) on May 11, 2021, as part of ongoing coordination. An updated Approved Jurisdictional Determination request letter was submitted to USACE on September 15, 2021 for wetlands and water resources located in the 130th Street station relocation project area. The Approved Jurisdictional Determination would be utilized to document commitments in the Final EIS. This Approved Jurisdictional Determination request letter covered water resources for the entire Preferred Alignment; therefore, results from coordination with USACE will be documented in both this Supplemental EA and the Final EIS.

3.1.9.2 Existing Conditions

The 130th Street station relocation project area for wetlands generally covers the area south of 130th Street to 132nd Street and east of Greenwood Avenue to west of the Beaubien Woods Forest Preserve access road. There is 0.15 acre of wetlands between 130th Street and Old 130th Street in the northern portion of the project area, as discussed in the Draft EIS. The remaining wetlands identified in the Draft EIS are located north of 130th Street, beyond the project area of this Supplemental EA (**Figure 3-10**). This 0.15 acre of wetlands is of low quality due to dominance of invasive common reed (*Phragmites australis*). No new area dominated by wetland vegetation was observed to be present based on the limited “windshield” reconnaissance. The wetland area previously identified between 130th Street and Old 130th Street did not appear to continue south of Old 130th Street. This reconnaissance did not include soil probes to assess hydric soil presence or hydrologic indicators and is not intended to substitute results of a wetland delineation. NRCS Web Soil Survey data indicated soil in the area to be “Urban land-Orthents, clayey, complex, nearly level," which has low hydric ratings at 5 percent of the map unit (NRCS 2021). During the May 11, 2021 site review meeting with USACE, a potential wetland was identified in the area north of 132nd Street and west of the access road into the Beaubien Woods Forest Preserve (**Figure 3-10**). USACE informally indicated that they would not consider any wetlands or other water resources in the project area to be jurisdictional. This determination would be finalized through the updated Approved Jurisdictional Determination request submitted to USACE on September 15, 2021. USACE has informally indicated that no new wetland delineation would be required.

3.1.9.3 Environmental Impacts

Permanent Impacts

The 130th Street station would be constructed south of Old 130th Street. The relocated 130th Street station would have fewer impacts on wetlands than the 130th Street station impacts disclosed in the Draft EIS.

In order to compare impacts outlined in the Draft EIS, wetland impacts north of 130th Street were also reviewed. The track alignment and the 130th Street station area in the Draft EIS (north of 130th Street) would impact up to approximately 7 acres of wetland. The track alignment extension connecting to the relocated 130th Street station area in this Supplemental EA would still impact approximately 0.21 acre of wetlands north of the 130th Street station relocation project area. Wetland impacts in the area north of 130th Street are generally associated with the 120th Street yard and shop refinement and are discussed further in **Section 3.2.1**. Wetlands located between 130th Street and Old 130th Street are expected to be outside of the 130th Street station and track realignment footprints and not be permanently or temporarily impacted by the 130th Street station. No wetlands would be impacted directly by the relocation of the 130th Street station.

There would be no permanent impacts on wetlands after mitigation.

Construction Impacts

No new construction impacts on wetlands are anticipated. All wetlands not impacted would be marked in the field and avoided during construction. Construction access, staging, and laydown would not have an impact on wetlands. As described in the Mitigation section, BMPs would be implemented to minimize erosion and sedimentation from construction areas. Coordination with USACE or other appropriate agency would occur for any wetlands identified in the project area.

There would be no construction impacts on wetlands after mitigation.

Figure 3-10: Wetlands in the Vicinity of the 130th Station Street Project Area

3.1.9.4 Mitigation

Impacts to any jurisdictional wetland would require compensatory mitigation, as directed by USACE. The following mitigation commitments are similar to those outlined in the Draft EIS to apply to this project construction:

- Restore any temporarily impacted wetlands to their pre-construction condition in coordination with USACE.
- Any newly identified wetland impact would require coordination with USACE. Any newly identified wetland impact would be required to be mitigated for as outlined in the Draft EIS and as directed by USACE.

The following mitigation commitments were not outlined in the Draft EIS but would also apply to project construction:

- Avoid and minimize temporary wetland disturbance for construction access and staging areas to the extent practicable. Wetlands would be clearly marked in the construction plans to ensure the contractor avoids wetland disturbance. BMPs, such as erosion and sediment control measures, would be implemented to prevent deposition and degradation of any wetlands near the project area.
- The Approved Jurisdictional Determination associated with the 2015 Wetland Delineation Report in the Draft EIS expired in June 2021. Field conditions in the project area for the 130th Street station relocation would be evaluated in a wetland delineation, if needed for permitting. An updated Approved Jurisdictional Determination letter was submitted to USACE on September 15, 2021. Coordination with USACE will continue through the Final EIS. Results from this coordination will be presented in the Final EIS. If a wetland delineation is requested, a report would be prepared summarizing the findings of the wetland delineation. This report would be shared with USACE during the permitting process. Impacts on any delineated wetlands would be coordinated with USACE, including request of an updated Approved Jurisdictional Determination, as needed. Impact coordination would proceed as needed based on the results of any Approved Jurisdictional Determination. Coordination materials are provided in **Attachment F**.

3.1.10 Environmental Justice

The 130th Street station relocation project area consists primarily of minority communities, which are also low-income communities. All the benefits and impacts of the RLE Project would occur within these minority and low-income communities. FTA and CTA have undertaken outreach and ongoing coordination with affected communities to identify environmental justice (EJ) populations and discuss project impacts, benefits, and mitigation measures.

CTA has been coordinating with EJ organizations within the project area and would continue the outreach to provide updates on design changes as the RLE Project progresses. CTA conducted public and agency outreach efforts after the announcement of the Preferred Alignment. The public outreach activities included informational materials to announce the Preferred Alignment, a press release, display ads, project website, postcard notifications, and a public open house meeting. Details of the public participation efforts are presented in **Chapter 5**.

3.1.10.1 Methods

The methods are the same as those described in the Draft EIS; however, updated data from the U.S. Census Bureau 2018 5-Year ACS data were used to identify EJ populations.

3.1.10.2 Existing Conditions

Because the 130th Street station area location south of 130th was not evaluated in the Draft EIS, the existing conditions are summarized in this section. This section describes the minority, low-income, and Limited English Proficiency (LEP) populations in the project area, which constitute the EJ populations for the purposes of this technical analysis. **The project area for EJ populations is defined as the area within ½ mile of the 130th Street station relocation.**

Variances in EJ population statistics since the Draft EIS publication in the project area, Riverdale community area and the City were examined. While the project area for the 130th Street station includes the Hegewisch and South Deering community areas, when evaluating the context of community cohesion and connectivity, the populated areas of those communities are more than a mile beyond the project area with substantial industrial development and existing roadway and railroad infrastructure already separating them from the project area. Therefore, neither Hegewisch nor South Deering are included in this analysis of the communities surrounding the 130th Street station relocation. While population has changed since the completion of the Draft EIS, the presence of EJ populations is approximately the same.

Minority Groups

The definition of minority populations has not changed since the Draft EIS. As shown in **Table 3-10,** all of the populated portions of the project area contain predominantly minority populations (99.1 percent). **Figure 3-11** identifies the percent of minority populations at the census block group level.

Table 3-10: Percent of Minority Populations in the Project Area and Affected Community Area

Area	Minority Populations
City of Chicago	69.9%
Project Area	99.1%
Riverdale	98.0%

Source: U.S. Census Bureau 2014-2018a

Table 3-11 shows the racial composition of the project area. The racial composition of the project area has not changed substantially since the Draft EIS. The Riverdale community area and the project area have a majority Black or African American population, which is consistent with the Draft EIS. Minority populations are prevalent throughout the 130th Street station relocation project area.

Table 3-11: Racial Composition within the Project Area and Affected Community Area

Area	White Alone	Hispanic Alone	Black or African American Alone	American Indian/Native Alaskan Alone	Asian Alone	Native Hawaiian and Other Pacific Islander Alone	Some Other Race Alone	Multiracial
City of Chicago	30.1%	25.9%	26.6%	0.3%	6.1%	0.0%	8.3%	2.7%
Project Area	0.9%	1.9%	96.8%	0.0%	0.5%	0.0%	0.0%	0.0%
Riverdale	1.6%	9.4%	88.6%	0.0%	0.3%	0.0%	0.0%	0.1%

Figure 3-11: Minority Populations by Census Block Group in the 130th Street Station Project Area

Low-Income Groups

The definition of low-income groups has not changed since the Draft EIS. **Table 3-12** displays the U.S. Department of Health and Human Services 2018 poverty guidelines.

Table 3-12: U.S. Department of Health and Human Services 2018 Poverty Guidelines

People in Household	Income
1	$12,140
2	$16,460
3	$20,780
4	$25,100
5	$29,420
6	$33,740
7	$38,060
8	$42,380

Source: U.S. Department of Health and Human Services 2018

The median household income in the project area is $11,314, which is less than the median household income for the City of Chicago and the Riverdale community area, as shown in **Table 3-13**. According to the U.S. Department of Health and Human Services 2018 poverty guidelines, three block groups in the project area have populations with median household income below poverty guidelines, as shown in **Table 3-14**. **Figure 3-12** displays the median income of block groups in the project area and identifies areas where median income and average household size suggest poverty status. Since the Draft EIS, median household income in the City of Chicago has increased by 17 percent while the median household income in Riverdale has increased by nearly 37 percent.

Table 3-13: Median Household Income in the Project Area and Affected Community Area

Area	Median Household Income
City of Chicago	$55,198
Project Area	$11,314
Riverdale	$13,518

Block Group 4, Census Tract 5401.01, Cook County, Illinois	$7,868	2.8	Riverdale
Block Group 2, Census Tract 5401.02, Cook County, Illinois	$17,719	2.9	Riverdale

Source: U.S. Census Bureau 2014-2018b, c

Note: Household size data not available at block group level.

Limited English Proficiency (LEP) Groups

According to the 2015 5-Year ACS, the majority of households in the project area speak English (**Table 3-15**). Spanish is the second most spoken language at home, with approximately 2 percent of the households in the project area speaking Spanish.

Table 3-15: Languages Spoken at Home within the Project Area and Affected Community Area

Area	English	Spanish	Other Indo-European Languages	Asian or Pacific Island Languages	Other Languages
City of Chicago	66.1%	20.1%	7.7%	4.3%	1.8%
Project Area	97.5%	1.6%	0.0%	0.4%	0.5%
Riverdale	97.1%	2.5%	0.0%	0.2%	0.2%

Source: U.S. Census Bureau 2011-2015

Identification of Environmental Justice Populations

Based on field observation and research, these geographic boundaries (block groups) do not artificially dilute or inflate the affected minority population and/or low-income population findings. The project area and surrounding community area comprise mostly minority populations. The median household income in the project area is lower than Riverdale and the citywide average. As such, the analyzed demographic data indicate the entire project area is made up solely of EJ populations.

3.1.10.3 Environmental Impacts

Permanent Impacts

Low-income and minority populations have been identified in the project area. However, there would be no disproportionately high and adverse human health or environmental impacts on minority and low-income populations from the 130th Street station relocation, as defined in Executive Order 12898. Access to adjacent properties would not change as a result of the 130th Street station relocation. There would be no isolation, exclusion, or separation of minority or low-income individuals within a given community or from the broader community. Right-of-way would need to be acquired for the 130th Street station relocation. However, no residences or businesses would be acquired. In addition, the relocated station would improve safety by eliminating the need for residents south of 130th Street to cross the busy roadway to access the previously proposed station location. The relocated 130th Street station would improve access to transit, jobs, and shopping and provide potential for development opportunities near the station area.

Construction Impacts

Construction impacts from the 130th Street station relocation on EJ populations would be the same as those described in the Draft EIS. As discussed in **Section 3.1.1.3**, there could be limited increases in traffic within the Altgeld Gardens neighborhood due to construction equipment and material delivery. CTA would phase construction to minimize impacts on local neighborhood traffic. Therefore, no adverse impacts to transportation would occur as a result of the 130th Street station relocation. As discussed in **Section 3.1.6.3**, there would be no new construction noise or vibration impacts due to the relocation of the 130th Street station. There would be no disproportionately high and adverse construction impacts on EJ populations due to the relocation of the 130th Street station.

3.1.10.4 Mitigation

The mitigation measures in this Supplemental EA and those incorporated by reference from the Draft EIS have been proposed by CTA, with input from local communities, consistently in EJ and non-EJ communities alike.

Mitigation measures documented in **Chapters 3** and **4** would be implemented. BMPs are required for this project area to further minimize dust and emissions during construction to ensure protection of children's health in line with Executive Order 13045 on Protection of Children from Environmental Health Risks and Safety Risks.

3.1.11 Safety and Security

3.1.11.1 Methods

The regulatory framework directing the safety and security analysis has not changed since the Draft EIS. A desktop review was conducted of information collected for the Draft EIS in comparison with the new safety and security analysis of the 130th Street station relocation.

3.1.11.2 Existing Conditions

The existing conditions for safety and security remain the same as those identified in the Draft EIS.

3.1.11.3 Environmental Impacts

Permanent Impacts

The relocation of the 130th Street station would enable residents of the Altgeld Gardens neighborhood access to the station through neighborhood roadways and their associated sidewalks without having to cross 130th Street. The relocation of 130th Street station would reduce the adverse safety impacts identified in the Draft EIS.

As stated in the Draft EIS, the public expressed concern regarding the potential for increased crime surrounding proposed stations because of the higher volume of people accessing the stations. Based on data from transit stations in Chicago and across the United States, the new stations would be unlikely to have much, if any, impact on neighborhood crime (Block and Davis 1996, Denver Regional Transportation District 2006, Liggett et al. 2003, Plano 1993, San Diego Association of Governments 2007); however, research indicates that some risk would remain, particularly in low-income neighborhoods (Ihlanfeldt 2003). The change in station location would not increase the number of people accessing the station; therefore, there are no new impacts due to the relocation of the 130th Street station. Mitigation measures would not be required. The closing of Old 130th Street would remove one of three access points to Carver Military Academy High School and a secondary access point for Beaubien Woods Forest Preserve. Old 130th Street turns into Doty Avenue east of the existing at-grade railroad crossing with the Conrail. The closure of the roadway is necessary to prevent the interaction of all modes of transportation with the new at-grade crossing that would be introduced with the RLE Project. The frequency of trains entering and departing the station warrants closure of the roadway to enhance safety. Emergency access to the Carver Military Academy High School and Beaubien Woods Forest Preserve would be maintained from 132nd Street from the north and from Doty Avenue from the south.

There would be no permanent adverse impacts on safety and security due to the relocation of the 130th Street station. No mitigation measures would be required.

Construction Impacts

Temporary construction activities would be the same as those identified in the Draft EIS. Job site safety would be maintained. Access would be maintained for first responders to provide community services without interruption.

There would be no adverse construction impacts on safety and security due to the relocation of the 130th Street station. No mitigation measures would be required.

3.1.11.4 Mitigation

Maintenance of traffic and job site safety and security mitigation measures proposed during construction at the 130th Street station are the same as those described in the Draft EIS. CTA is preparing a Threat and Vulnerability Assessment and Preliminary Hazard Analysis for the RLE Project. However, these assessments discuss sensitive information; therefore, the Threat and Vulnerability Assessment and Preliminary Hazard Analysis will not be available to the public. Recommendations from both assessments will be documented in the Final EIS.

There would be no adverse impacts on safety and security due to the relocation of the 130th Street station after mitigation.

3.1.12 Air Quality

3.1.12.1 Methods

The regulatory framework directing the air quality analysis and the methodology have not changed since the Draft EIS.

3.1.12.2 Existing Conditions

Because the 130th Street station area location change was not evaluated in the Draft EIS, the existing conditions are summarized in this section. In the Draft EIS, the 8-hour ozone measurement at the 7801 Lawndale monitor location exceeded the National Ambient Air Quality Standards (NAAQS). The 8-hour ozone measurement for the station relocation would also exceed the NAAQS; this has not changed since the Draft EIS. In the Draft EIS, Cook County was designated as a nonattainment area for the 8-hour ozone and particulate matter with an aerodynamic diameter of 2.5 micrometers and less ($PM_{2.5}$) with respect to the NAAQS. Cook County is still designated as a nonattainment area for the 8-hour ozone and $PM_{2.5}$; this has not changed since the Draft EIS.

3.1.12.3 Environmental Impacts

Permanent Impacts

The 130th Street station relocation would result in additional vehicular traffic on nearby streets. To analyze vehicular traffic near the relocated 130th Street station, CTA evaluated level of service (LOS) at 16 locations within the project area, as depicted in **Figure 3-2**. **Table 3-4** shows the future intersection LOS evaluated for the 130th Street station relocation, and all intersections would operate at LOS A, B, or C.

The U.S. Environmental Protection Agency (USEPA) modeling guidance provides that intersections operating at LOS A, B, or C do not require further analysis and would not likely cause or contribute to potential carbon monoxide (CO) exceedances of the NAAQS (USEPA 1992). Because all intersections would operate at LOS A, B, or C from additional vehicle traffic within the project area, the 130th Street station relocation would not result in an exceedance of the health-based NAAQS for CO at intersections. There would be no new permanent adverse impacts on air quality due to the relocation of the 130th Street station. No mitigation measures would be required.

The automobile and bus trips generated by the relocated 130th Street station would not be higher than those generated by the 130th Street station proposed in the Draft EIS. Air emissions from traffic would be relatively low, based on the LOS at intersections within the project area. To further reduce potential diesel emissions from buses operating at the relocated 130th Street station, CTA has been updating its bus fleet to include electric buses and clean-diesel buses that would continue to meet current USEPA emissions requirements. CTA has committed to a full electrification of the bus fleet by 2040, which would provide air quality improvements to the region and the immediate vicinity of the facilities. Similarly, the Pace bus fleet at the relocated 130th Street station would meet USEPA guidelines for clean diesel, and many Pace buses serving the south Chicago area use compressed natural gas (CNG), a fuel source that emits fewer greenhouse gases than diesel.

The 130th Street station relocation would not change the regional vehicle miles traveled (VMT) from the VMT disclosed in the Draft EIS. There would be no new regional emissions of greenhouse gases (GHGs), $PM_{2.5}$, and mobile source air toxics (MSAT) associated with VMT. There would be no adverse air quality impacts from GHGs, $PM_{2.5}$, and MSAT due to the relocation of 130th Street station. No mitigation measures would be required.

In its conformity analysis, CMAP concluded that the *ON TO 2050 Plan* and the Transportation Improvement Program (TIP) meet all applicable requirements for conformity for the 8-hour ozone standard and the annual $PM_{2.5}$ standard (CMAP 2018b). The Draft EIS concluded that the RLE Project would conform to the State Implementation Plan (SIP) because the RLE Project was included in CMAP's GO TO 2040 Comprehensive Plan and would decrease $PM_{2.5}$ emissions. The RLE Project would still conform to the SIP because it is included in CMAP's *ON TO 2050* and TIP and because the RLE Project would decrease $PM_{2.5}$ emissions. The 130th Street station relocation would also conform to the SIP; this has not changed since the Draft EIS.

Construction Impacts

Impacts during construction would be associated with temporary and localized emissions of fugitive dust and exhaust from construction vehicles and equipment. Construction-related adverse air quality impacts from the 130th Street station relocation would be the same as those described in the Draft EIS. There would be no new construction-related adverse impacts on air quality due to the relocation of the 130th Street station. No mitigation measures would be required.

3.1.12.4 Mitigation

Mitigation measures proposed for the 130th Street station relocation would be the same as those described in the Draft EIS. As outlined in the Draft EIS, construction mitigation would include BMPs, such as USEPA's Construction Emission Control Checklist, to reduce construction dust, emissions controls on construction equipment, use of low-sulfur fuels, and by limiting equipment operations such as excessive idling. In addition, the contractor would follow Chicago's Clean Diesel Construction Ordinance, which would reduce the potential for construction-related air quality impacts. No additional mitigation measures would be required. Construction impacts on air quality would not be adverse after mitigation.

3.1.13 Water Resources

3.1.13.1 Methods

The regulatory framework directing the water resources analysis and the methodology have not changed since the Draft EIS.

3.1.13.2 Existing Conditions

Because the 130th Street station area location south of 130th was not evaluated in the Draft EIS, the existing conditions are summarized in this section. The project area for water resources generally covers the area south of 130th Street to 132nd Street and east of Greenwood Avenue to west of the Beaubien Woods Forest Preserve access road. No water resources, inclusive of ponds, streams, rivers, and similar water bodies, are in the project area based on field observation. Larger wetland complexes associated with Beaubien Woods Forest Preserve are located to the south and southeast of the 130th Street station. The Illinois Coastal Management Program boundary follows 130th Street. The 130th Street station in the Draft EIS was outside this boundary. However, the relocated 130th Street station would be within the boundaries of the Illinois Coastal Management Program. This has changed since the Draft EIS.

3.1.13.3 Environmental Impacts

Permanent Impacts

As described in the Draft EIS, stormwater drainage from the relocated 130th Street station would be sent to the existing stormwater system. Design features would be included to manage stormwater drainage so as not to overload the existing stormwater system. Since the relocated 130th Street station would have a similar footprint as the 130th Street station proposed in the Draft EIS, there would be no new permanent adverse impacts on water resources from the relocation of the 130th Street station.

Coordination with the Illinois Department of Natural Resources (IDNR), Illinois Coastal Management Program occurred on November 20, 2020 and March 31, 2021 regarding the need for a federal consistency review. Per IDNR guidance, CTA submitted an initial federal consistency review request to IDNR on August 27, 2021 requesting a determination as to whether a federal consistency review would be necessary for the Project. On a letter dated October 8, 2021, IDNR concurred that the relocated 130th Street station would comply with the enforceable policies of the Illinois Coastal Management Program and would be conducted in a manner consistent with the Illinois Coastal Management Program. Therefore, the relocated 130th Street station would have no permanent adverse impacts on the Illinois coastal zone. Coordination with IDNR regarding the federal consistency determination has finalized. Coordination materials are included in **Attachment F**.

Construction Impacts

There would be no new construction-related impacts on water resources due to the relocation of the 130th Street station. Potential for erosion and sedimentation from construction areas on nearby water resources would be minimized through implementation of BMPs described in the Draft EIS.

3.1.13.4 Mitigation

Water quality mitigation measures would be the same as those identified in the Draft EIS for other project segments described in that document. No additional mitigation measures are anticipated to be necessary at this time. There would be no adverse impacts to water resources after mitigation.

3.1.14 Biological Resources

3.1.14.1 Methods

Information compiled for the Draft EIS was reviewed and verified based on all updated information from sources identified in the Draft EIS, including Illinois species information obtained from IDNR Illinois Ecological Compliance Assessment Tool (EcoCAT), USFWS species data obtained from the Information for Planning and Consultation (IPaC) system, and aerial review. The majority of the review area from the Draft EIS was previously assessed between the Common UPRR Alternative and the BRT Alternative (along Michigan Avenue). A "windshield" survey verification of habitat areas was also completed on October 27, 2020 to assess the project area not previously evaluated in the Draft EIS. This review was intended to be supplementary to desktop level evaluations and is not intended to be a substitute for a formal field habitat evaluation or wetland delineation. Tree coverage was estimated with a desktop evaluation with high definition NearMap imagery dated September 25, 2020.

3.1.14.2 Existing Conditions

The project area for biological resources is defined as the area within ¼ mile of the proposed track centerline. After the publication of the Draft EIS, CHA demolished Blocks 11, 12, and 13. The area for Blocks 11 and 13, where the 130th Street station would be located, was converted to open space dominated by mowed/maintained turf grasses. Urban landscaped trees located in the area surrounding the demolition were kept in place. Other trees are present in two main areas: the railroad right-of-way and along 130th Place. The two tree corridors are generally described as including early successional and non-native species located in two distinct bands or corridors. Observed species include eastern cottonwood (*Populus deltoides*) and oak species (*Quercus sp.*). Tree canopy coverage is estimated to be approximately 100 feet at its widest point and 30 feet at its most narrow point. The total acreage of tree clusters in the relocated 130th Street station project area is 5.7 acres. Trees in this area are fragmented from any nearby forested area by transportation infrastructure and urban maintenance. A similar band of trees continues to the southeast across 132nd Street, extending into the Beaubien Woods Forest Preserve. Trees in the area may be utilized by migratory bird species as stopover points to designated natural areas near Lake Calumet and the Little Calumet River. The mowed turf grass open space is limited in diversity and does not provide substantial opportunities for forage or shelter in comparison to the woods and wetlands located south and southeast of this area. Habitat that is present is most likely utilized by urban-adapted species. The removal of residential buildings from the three Altgeld Gardens blocks increased the open green space in the area by approximately 23 acres. **Photograph 3-4** depicts vegetation in the 130th Street station project area.

Photograph 3-4: View of Typical Landscape in the 130th Street Station Project Area

The Draft EIS identified the peregrine falcon (*Falco peregrinus*) as the only state-listed species with potential to occur in the project area. However, this species was removed from state lists since the analysis was conducted for the Draft EIS. The USFWS IPaC system identified eight federally threatened or endangered species that may occur in the project area. Six of these species are discussed in the Draft EIS and are not considered further in this Supplemental EA. The two newly identified species are discussed further below. Mead's milkweed (*Asclepias meadii*) was previously identified in the Draft EIS as a listed species with potential to occur in the area but is not included in the IPaC report for the 130th Street station relocation project area. The IDNR EcoCAT review identified four protected species that may be in the vicinity of the project location. Three of these species were analyzed in the Draft EIS with a determination that no habitat is in the area. There is no new habitat type identified as potentially present in the project area; therefore, these species are not discussed further in this Supplemental EA. The remaining species is discussed below. The EcoCAT review results also included the Lake Calumet Illinois Natural Areas Inventory Site to the east of the RLE Project, as described in the Draft EIS. The IPaC and EcoCAT reports for the 130th Street station relocation are included in **Attachment G**.

The rufa red knot (*Calidris canutus rufa*) and the northern long-eared bat (NLEB) (*Myotis septentrionalis*) were added to the federal list for Cook County since the Draft EIS analysis. Both species have the potential to occur in the project area according to the IPaC review (**Table 3-16**).

No suitable habitat (i.e., coastal areas of large wetland complexes for migratory stopovers) for the rufa red knot was identified in the project area during the windshield survey or was identified as likely to be present based on review of other documents. Therefore, the rufa red knot is unlikely to occur in the project area.

Summer roosting habitat for the NLEB includes loose (exfoliating) tree bark, tree crevices, or snags. The NLEB has also been known to roost in man-made structures. Foraging habitat includes forest and below-canopy areas in primarily upland forests on hillsides and ridges as well as along paths, ponds, and streams at forest edges. Suitable habitat for the NLEB is not present at this location. The NLEB may be transient through the area, but more suitable foraging and roost habitat is likely to be present in the wooded areas along the Little Calumet River. The NLEB is not listed in the EcoCAT report. Coordination with USFWS under Section 7 of the Endangered Species Act regarding this species for this Supplemental EA has been completed as discussed in **Section 3.1.14.4**.

The rusty patched bumble bee (*Bombus affinis*) was also added to the federal list for Cook County since the Draft EIS analysis. The project area is outside the range of this species, as identified by the USFWS Environmental Conservation Online System. This species was not identified in the IPaC report.

Table 3-16: Species Analyzed in the 130th Street Station Project Area

Species	Status	Habitat Requirements	Likelihood of Occurrence
Mammals			
Northern Long-Eared Bat *Myotis septentrionalis*	FT, ST	Winter habitat includes caves and mines suitable for hibernation. Summer habitat includes trees with loose (exfoliating) bark or crevices of live trees or snags.	Unlikely; habitat does not occur in project area.
Birds			
Rufa Red Knot *Calidris canutus rufa*	FT	Coastal areas or large wetland complexes for migratory stopovers.	Unlikely; habitat does not occur in project area.

Sources: IDNR 2020; USFWS 2017

Notes: FT = Federal threatened; ST = State threatened

The only state-listed species newly identified by the updated EcoCAT search is the state-endangered osprey (*Pandion haliaetus*). This species was discussed in the Draft EIS as a state-listed species. No suitable habitat for this species was identified in the project area evaluated in the Draft EIS, and no suitable habitat was observed during the windshield survey, consistent with the findings outlined in the Draft EIS.

3.1.14.3 Environmental Impacts

Permanent Impacts

There would be permanent adverse impacts on biological resources. Trees would be removed in the vicinity of the station. The total quantity of trees removed would be up to 5.7 acres, plus scattered urban landscape trees or isolated trees. Reduction in habitat would occur but would not constitute a substantial loss compared to larger natural areas available associated with the Beaubien Woods Forest Preserve. The loss of trees would reduce migratory bird habitat. Better suitable areas of habitat are available in proximity to the station. Suitable bat roost trees are not expected to be in this area. Mitigation measures would be required, including following local tree ordinances, timing of vegetation removal, and nesting bird surveys.

Construction Impacts

Trees would be removed in the project area, as defined under the Permanent Impacts section. Tree removal would reduce the urban tree inventory. Tree removal would potentially impact migratory birds and urban-adapted wildlife through removal of roosting areas. The potential impact to migratory birds would be minimal with the implementation of mitigation measures, such as timing of tree removal.

There would be no adverse construction impacts on biological resources after mitigation.

3.1.14.4 Mitigation

Mitigation measures proposed at the 130th Street station relocation are generally the same as those described in the Draft EIS. Mitigation measures incorporated from the Draft EIS include timing of tree removal to occur outside of the nesting bird season, nesting bird surveys if constructing inside of the nesting bird season, and compliance with local tree ordinances. A tree survey may be needed for permitting and/or local tree protection ordinances to assess the number, species, and health status of trees to be removed. If the tree survey is required, CTA would coordinate tree removal with USFWS and local authorities, as necessary. The Bureau of Forestry under the City of Chicago Department of Streets and Sanitation oversees the removal of public trees.

On September 3, 2021, CTA submitted a request to USFWS for review of the No Effect finding for the rufa red knot (**Attachment G**). This request also included the Project Submittal Form for the Range-wide Programmatic Consultation for Indiana Bat and Northern Long-eared Bat for the May

Affect, Likely to Adversely Affect determination for the NLEB in accordance with the *Programmatic Biological Opinion for Transportation Projects in the Range of the Indiana Bat and Northern Long-Eared Bat* (USFWS 2018). CTA requested concurrence with this determination or agency information that indicates there is no suitable habitat for this species. On September 28, 2021, USFWS agreed with the No Effect determination for the rufa red knot (**Attachment G**). USFWS recommended a May Affect, Not Likely to Adversely Affect determination for the NLEB after implementation of the mitigation measures discussed above. As such, there would be no adverse impacts on biological resources after mitigation.

An IDNR EcoCAT request was submitted for formal project consultation on November 17, 2021. On November 24, 2021, IDNR determined that impacts would be unlikely with the implementation of mitigation measures. The IDNR EcoCAT request and response are provided in **Attachment G**. For the protection of wildlife associated with Lake Calumet, all lighting would be fully shielded fixtures that emit no light upward. Only "warm-white" or filtered light emitting diode (LED) (CCT < 3,000 K; S/P ratio <1.2) would be used to minimize blue emission. Only the exact space would be lit with the amount (lumens) needed to meet industry safety requirements. For protection of the osprey, removal of vertical structures such as telephone poles and light poles would be done between November 1 and March 31. If these dates could not be accommodated, a nesting survey would be conducted to determine if species are utilizing structures in the project area. Survey results and methodology will be coordinated with IDNR.

3.1.15 Indirect and Cumulative Impacts

This section identifies and assesses any new potential indirect and cumulative impacts relative to the 130th Street station relocation. The resource areas that exhibit indirect and cumulative impacts are discussed below.

3.1.15.1 Existing Conditions

Reasonably foreseeable projects include projects identified in *ON TO 2050*, the TIP, and known private development and redevelopment projects in the project area. There are no new reasonably foreseeable projects identified in the project area for 130th Street station relocation since the Draft EIS.

3.1.15.2 Environmental Impacts

Indirect Impacts

Implementation of the 130th Street station relocation would have the potential for indirect benefits to the project area by increasing accessibility and attracting redevelopment in Altgeld Gardens. CTA is undertaking a *Transit-Supportive Development (TSD) Comprehensive Plan* to identify the potential for TOD around each station area. The results of this study will guide the future land uses.

The station area improvements would provide connections to proposed bikeways within the RLE project area. Enhancements would include additional connections to the Altgeld Gardens neighborhood from the Beaubien Woods Forest Preserve, as discussed in **Chapter 4**.

FPCC provided their request for mitigation measures to CTA to minimize impacts from the closure of the secondary access point to the Beaubien Woods Forest Preserve in a memorandum dated May 13, 2021. CTA concurred with the mitigation measures listed in **Chapter 4**. There would be no adverse indirect impacts due to the relocation of the 130th Street station.

Cumulative Impacts

Since the Draft EIS was published, the removal of the buildings on the three CHA blocks within Altgeld Gardens has contributed cumulatively on the relocation of the 130th Street station. Demolition of Blocks 11, 12, and 13 of Altgeld Gardens was conducted by CHA in 2017, after publication of the Draft EIS; this demolition was independent and unrelated to the RLE Project.

Like the Draft EIS, the cumulative impacts of the 130th Street station south of 130th Street would be beneficial to the surrounding communities because it would improve access to jobs, places of interest, and residences by providing closer public transportation to residents that would be reached without having to cross 130th Street, a major roadway.

There would be no adverse cumulative impacts due to the relocation of the 130th Street station.

Construction Impacts

There would be no indirect or cumulative construction impacts from the relocated 130th Street station.

3.2 120th Street Yard and Shop Refinement

This section evaluates and compares impacts resulting from the refinement of the 120th Street yard and shop to those identified in the Draft EIS when the yard was located approximately 100 feet to the east. **Figure 3-13** depicts the 120th Street yard and shop footprint in the Draft EIS and the refined footprint subject of analysis in this Supplemental EA.

3.2.1 Wetlands

3.2.1.1 Methods

A desktop review was conducted of information collected for the Draft EIS in comparison with the project area for the 120th Street yard and shop refinement and updated database information. Resources reviewed included the 2015 Wetland Delineation Report prepared as part of the Draft EIS, the USFWS NWI, NRCS Web Soil Survey, and updated aerial imagery. In addition, CTA conducted a field “windshield” reconnaissance on October 17, 2020, which included presence/absence confirmation of wetland areas. The “windshield” reconnaissance was necessarily limited to areas visible from publicly accessible roadways and to corroborate information reviewed during the desktop analysis. The area reviewed included the publicly accessible roads in the project area and the landscape clearly visible from those spaces. The area traversed included Cottage Grove Avenue from 130th Street extending east to the railroad tracks and traversing north on the track adjacent access road to Kensington Avenue. Because the 2015 Wetland Delineation Report expired June 2021, a new wetland delineation would be conducted to evaluate the field conditions in the project area, if required for permitting or coordination. Coordination with USACE is ongoing to determine final requirements.

A site review meeting was held with a representative of USACE on May 11, 2021, as part of ongoing coordination. An updated Approved Jurisdictional Determination request was submitted to USACE on September 15, 2021 for wetlands and water resources located in the 120th Street yard and shop refinement project area. The Approved Jurisdictional Determination would be utilized to document commitments in the Final EIS. This Approved Jurisdictional Determination request letter covered water resources for the entire Preferred Alignment; therefore, results from coordination with USACE will be documented in both this Supplemental EA and the Final EIS. In addition to wetlands and water resources in the area of the 120th Street yard and shop, the Approved Jurisdictional Determination also included a request for a Letter of No Objection from USACE to the use of Kensington Marsh for stormwater drainage (**Attachment F**). Kensington Marsh is owned by MWRD, which requires this statement of no objection for further coordination and approval for placement of a stormwater drainage outlet into Kensington Marsh. The Final EIS will document coordination with USACE and MWRD regarding the use of Kensington Marsh.

3.2.1.2 Existing Conditions

The 120th Street yard and shop refinement project area for wetlands generally covers the yard and shop refinement footprint from 115th Street to 130th Street, bounded by the All American Recycling facility and the MWRD Calumet Water Reclamation Plant to the west and the NICTD/CSS & SBRR tracks to the east.

Of the 15.22 acres of wetlands identified in the 130th Street station and the 120th Street yard and shop area in the Draft EIS, 14.28 acres of wetlands are in the 120th Street yard and shop project area, generally defined as the project area between Kensington Avenue and 130th Street. Most wetlands identified in the delineation report were recorded as degraded or otherwise low quality due to the dominance of invasive common reed. Review of updated aerial imagery in combination with the “windshield” reconnaissance conducted on October 17, 2020 indicated that the results of the 2015 wetland delineation are likely to remain accurate. Wetlands observed from the traversed area were dominated by common reed, and generally appeared to be of low quality due to the near complete dominance of the invasive common reed. **Figure 3-14** depicts wetlands delineated in and near the 120th Street yard and shop refinement project area. NRCS information indicated hydric components of soil in the yard area ranged between 0 and 6 percent hydric components (NRCS 2021). The majority of new project area is located at the north end of the 120th Street yard and shop refinement footprint. Aerial imagery review, in comparison with the 2015 Wetland Delineation Report, does not appear to have any vegetative difference in coverage between upland areas identified and the adjacent new footprint. This approach is limited to results available from aerial interpretation. No new wetland areas in the project area were identified. Coordination with

USACE is ongoing, and conditions for the Final EIS will be updated based on USACE recommendations.

During the May 11, 2021 site review meeting with USACE, the area covered by the original Approved Jurisdictional Determination was analyzed for potential connectivity. In addition, a potential wetland area dominated by common reed was identified in a narrow-vegetated strip between the roadway and the All American Recycling facility, totaling 0.17 acre in area. USACE informally indicated that they concurred with the original Approved Jurisdictional Determination and would not consider any resources in or adjacent to the project area to be jurisdictional. This determination would be finalized through the updated Approved Jurisdictional Determination request submitted to USACE on September 15, 2021. Coordination materials are provided in **Attachment F**.

Figure 3-14: Wetlands in the Vicinity of the 120th Street Yard and Shop Refinement Project Area

3.2.1.3 Environmental Impacts

Permanent Impacts

Permanent impacts on wetlands from the 120th Street yard and shop refinement are anticipated to be functionally the same as those described in the Draft EIS. USACE provided an Approved Jurisdictional Determination on October 3, 2016, indicating that there are no waterways, wetlands, or other areas considered "waters of the United States" under their jurisdiction in the delineated area. This determination is valid for 5 years from its issue date of June 29, 2016, and expired in June 2021. A new wetland delineation may be required for permitting, as stated in the mitigation section. Coordination with USACE or other appropriate agency would occur for any wetlands identified in the project area.

The MWRD Water Management Ordinance does not apply to isolated wetlands inside the City of Chicago limits. There is no regulatory requirement for compensation of these wetland impacts.

Wetland impact quantities have slightly decreased when compared to those identified in the Draft EIS. There would be no new permanent impacts on wetlands from the 120th Street yard and shop refinement.

Construction Impacts

No new construction impacts on wetlands are anticipated, as no new wetlands have been identified by the described resource review in the shop and yard area. Construction access, staging, and laydown would not have an impact on wetlands. As described in the mitigation section, BMPs would be implemented to minimize erosion and sedimentation from construction areas. Coordination with USACE or other appropriate agency would occur for any wetlands identified in the project area.

There would be no construction impacts on wetlands after mitigation.

3.2.1.4 Mitigation

No jurisdictional wetlands requiring mitigation commitments have been identified in the 120th Street yard and shop project area. Impacts to any jurisdictional wetland would require compensatory mitigation, as directed by USACE. The following mitigation commitments, similar to those identified in the Draft EIS, would apply to project construction:

- Restore any temporarily impacted wetlands to their pre-construction condition in coordination with USACE.

- Any newly identified wetland impact would require coordination with USACE. Any newly identified wetland impact would be required to be mitigated as outlined in the Draft EIS and as directed by USACE.

The following mitigation commitments were not outlined in the Draft EIS but would also apply to project construction:

- Avoid and minimize temporary wetland disturbance for construction access and staging areas to the extent practicable. Wetlands would be clearly marked in the construction plans to ensure the contractor avoids wetland disturbance. BMPs, such as erosion and sediment control measures, would be implemented to prevent deposition and degradation of any wetlands near the project area.

- The Approved Jurisdictional Determination associated with the 2015 Wetland Delineation Report in the Draft EIS expired June 2021, and it does not include the new area within the project footprint. Field conditions in the project area for the 120th Street yard and shop would be evaluated in a wetland delineation, as may be needed for permitting. An updated Approved Jurisdictional Determination letter was submitted to USACE on September 15, 2021. Coordination with USACE will continue through the Final EIS. If requested, a report would be prepared summarizing the findings of the wetland delineation. This report would be shared with USACE during the permitting process. Impacts on any delineated wetlands would be coordinated with USACE, including request of an updated Approved Jurisdictional Determination, as needed. Impact coordination would proceed as needed based on the results of any Approved Jurisdictional Determination. Coordination materials are provided in **Attachment F**.

3.2.2 Biological Resources

3.2.2.1 Methods

Information compiled for the Draft EIS was reviewed and verified based on all updated information from sources identified in the Draft EIS, including Illinois species information obtained from IDNR EcoCAT, USFWS IPaC species data, and aerial review. A “windshield” survey verification of habitat areas was completed on October 27, 2020. The review was necessarily limited to areas visible from publicly accessible roadways. This review was intended to be supplementary to desktop level evaluations and is not intended to be a substitute for a formal field habitat evaluation or wetland delineation. Observed conditions matched those described in the Draft EIS. Other resources reviewed do not indicate there is any new habitat type present in the project area that would be affected. Tree coverage was estimated with a desktop evaluation with high definition NearMap imagery dated September 25, 2020.

3.2.2.2 Existing Conditions

The project area for biological resources in the 120th Street yard and shop is defined as the area within a ¼ mile around the proposed track centerline. The existing conditions in the project area are generally similar to those described in the Draft EIS. Based on a 2012 survey, the Draft EIS characterized the area as being defined by young cottonwood forest with pockets of common reed. Historic review indicated that the area began to turn to forest around 2005/2007. This meets the description of an early successional forest area. Observations in the field corroborated a large presence of cottonwood trees in the area. Based on an aerial review, as described in the methodology section, there are 42.8 acres of trees in the project area. The Draft EIS identified approximately 41.9 acres of vegetation in the 120th Street yard and shop project area. The "windshield" survey conducted on October 27, 2020 included observation of vegetation throughout the project area, which mainly consisted of early successional trees located in the railroad right-of-way. As identified in the Draft EIS, the 120th Street yard and shop project area is dominated by cottonwood trees and non-native species, which represent low-quality habitat. Aerial interpretation indicated vegetation farther from publicly accessible roadways did not change in vegetative composition. Wetlands in the area are dominated by common reed, which also provides low habitat value. **Photographs 3-5** and **3-6** depict vegetation in the 120th yard and shop refinement project area.

Photograph 3-5: View of Landscape in the 120th Street Yard and Shop Refinement Project Area

Photograph 3-6: View of Landscape in the 120th Street Yard and Shop Refinement Project Area

The Draft EIS identified the peregrine falcon (*Falco peregrinus*) as the only state-listed species with potential to occur in the project area. However, this species was removed from state lists since the analysis was conducted for the Draft EIS. The USFWS IPaC system identified eight federally threatened or endangered species that may occur in the project area. Six of these species are discussed in the Draft EIS and are not considered further in this Supplemental EA. The two newly identified species are discussed further below. Mead's milkweed (*Asclepias meadii*) was previously identified in the Draft EIS as a listed species with potential to occur in the area but is not included in the IPaC report for the 120th Street shop and yard refinement project area. The IDNR EcoCAT review identified four protected species in the vicinity of the project location. Three of these species were analyzed in the Draft EIS with a determination that no habitat is in the area. There is no new habitat type identified as potentially present in the project area; therefore, these species are not discussed further in this Supplemental EA. The remaining species are discussed below. The EcoCAT review results also included the Lake Calumet Illinois Natural Areas Inventory Site to the east of the RLE Project, as described in the Draft EIS. The IPaC and EcoCAT reports for the 120th Street yard and shop are included in **Attachment G**.

The rufa red knot and the NLEB were added to the federal list for Cook County since the Draft EIS analysis. Both species have the potential to occur in the project area according to the IPaC review (**Table 3-18**). No suitable habitat (i.e., coastal areas of large wetland complexes for migratory stopovers) for the rufa red knot was identified in the project area during the windshield survey or was identified as likely to be present based on review of other documents. Therefore, the rufa red knot is unlikely to occur in the project area.

Suitable habitat for the NLEB may be present in limited quantities in the 120th Street yard and shop refinement project area. The bat spends winter months hibernating in caves and mines, referred to as hibernacula (USFWS 2015). During the active summer period, NLEBs roost singly or in colonies underneath loose bark or in cavities or crevices of live and dead trees (snags). They are rarely found roosting in human structures such as barns or sheds. The young cottonwood tree dominated forest described in the area would not typically provide suitable roosting opportunities. Dead or damaged trees of this species may provide suitable roosting areas; however, these relatively young trees are not anticipated to be in this condition. Under a conservative approach, due to the lack of complete access to the project area, it is assumed that limited suitable tree roost habitat may be found in the 120th Street yard and shop refinement project area. Suitable typical mitigation measures have been assumed to be necessary at this stage. The 120th Street yard and shop refinement project area was partially inaccessible and, therefore, not possible to review in the field. Field observations were used in conjunction with review of desktop information and information collected during development of the Draft EIS to extrapolate site conditions. The EcoCAT report did not list the NLEB as a protected resource that may be in the vicinity of the project area. A bat habitat survey has not been completed for this area, and the need for one has not been determined at this time. If it is determined that a bat habitat survey is needed, a bat habitat survey would be completed during the Final EIS. Under a conservative approach, it is assumed that NLEB habitat may be present in the 120th Street yard and shop refinement project area. Coordination with USFWS under Section 7 of the Endangered Species Act regarding this species for this Supplemental EA has been completed as discussed in **Section 3.2.2.4**. The rusty patched bumble bee (*Bombus affinis*) was also added to the federal list for Cook County since the Draft EIS analysis. The project area is outside the range of this species, as identified by the USFWS Environmental Conservation Online System. This species was not identified in the IPaC report.

Table 3-18: Species Analyzed in the 120th Street Yard and Shop Project Area

Species	Status	Habitat Requirements	Likelihood of Occurrence
Mammals			
Northern Long-eared Bat *Myotis septentrionalis*	FT, ST	Winter habitat includes caves and mines suitable for hibernation. Summer habitat includes trees with loose (exfoliating) bark or crevices of live trees or snags.	Potential to occur due to potential suitable habitat in the project area.
Birds			
Rufa Red Knot *Calidris canutus rufa*	FT	Coastal areas or large wetland complexes for migratory stopovers.	Unlikely; habitat does not occur in project area.

Sources: IDNR 2020; USFWS 2017

Notes: FT = Federal threatened; ST = State threatened

The only state-listed species newly identified by the updated EcoCAT search is the state-endangered osprey (*Pandion haliaetus*). This species was discussed in the Draft EIS as a state-listed species. No suitable habitat for this species was identified in the project area evaluated in the Draft EIS, and no suitable habitat was observed during the windshield survey, consistent with the findings outlined in the Draft EIS.

3.2.2.3 Environmental Impacts

Permanent Impacts

There would be permanent adverse impacts on biological resources. Permanent impacts from the 120th Street yard and shop refinement area would be the same as those described in the Draft EIS, with the potential to adversely affect vegetation and wildlife habitat. Trees would be removed in the vicinity of the yard and shop. The total quantity of trees removed would be up to 42.8 acres, plus scattered isolated trees in the area. Reduction in habitat would occur but would not constitute a substantial loss due to fragmented areas that are somewhat isolated by surrounding industrial and transportation uses.

The loss of trees would reduce migratory bird habitat. Migratory species passing through the Chicago urban core are likely to be adapted to urban habitat and are highly mobile, able to overcome industrial and land use barriers between the project area and more natural areas. Suitable bat roost trees have a minimal likelihood of being present. Mitigation measures would be required, including following local tree ordinances, timing of vegetation removal, and nesting bird surveys. There would be no new adverse impacts on biological resources from the refinement of the 120th Street yard and shop refinement.

Construction Impacts

As in the Draft EIS, trees would be removed in the project area. The majority of trees are early successional trees, including cottonwoods and non-native species. Slightly more trees would be removed in the 120th Street yard and shop refinement project area when compared to the original footprint. Tree removal would potentially impact migratory birds and urban-adapted wildlife through removal of roosting areas. Minimally increased quantities of urban tree removal would not change the determinations of the Draft EIS. Tree removal would potentially impact migratory birds during construction. In addition, any removal of suitable roost trees, if present, would have the potential to impact the NLEB. Typical mitigation measures for the protection of the NLEB are proposed and would be finalized in coordination with USFWS.

There would be adverse construction impacts on biological resources. These impacts include the potential loss of habitat and disruption of normal activity resulting from construction noise and activity. Mitigation measures would be required.

3.2.2.4 Mitigation

Mitigation measures proposed for the 120th Street yard and shop refinement are the same as those described in the Draft EIS. A tree survey may be needed for permitting and/or local tree protection ordinances to assess the number, species, and health status of trees to be removed. If the tree survey is required, CTA would coordinate tree removal with USFWS and local authorities, as necessary. The Bureau of Forestry under the City of Chicago Department of Streets and Sanitation oversees the removal of public trees.

Tree removal would not have adverse impacts on migratory birds during construction after mitigation. Mitigation measures incorporated from the Draft EIS include timing of tree removal to occur outside of the nesting bird season, nesting bird surveys if constructing inside of the nesting bird season, and compliance with local tree ordinances. Tree removal mitigation measures identified for the NLEB may include restrictive dates on tree clearing, similar in nature to those identified for migratory birds in the Draft EIS. Tree removal activities would occur outside of the NLEB active season (April 1 through October 31) in accordance with the *Programmatic Biological Opinion for Transportation Projects in the Range of the Indiana Bat and Northern Long-Eared Bat* (USFWS 2018). This would minimize impacts to pups, if any are present in potentially suitable habitat in the area. In addition, coordination with USFWS would be completed for the Final EIS to finalize any commitments related to clearing of trees in this area. Mitigation measures may additionally include compensatory mitigation. No compensatory mitigation has been identified at this time.

On September 3, 2021, CTA submitted a request to USFWS for review of the No Effect finding for the rufa red knot (**Attachment G**). This request also included the Project Submittal Form for the Range-wide Programmatic Consultation for Indiana Bat and Northern Long-eared Bat for the May

Affect, Likely to Adversely Affect determination for the NLEB in accordance with the *Programmatic Biological Opinion for Transportation Projects in the Range of the Indiana Bat and Northern Long-Eared Bat* (USFWS 2018). CTA requested concurrence with this determination or agency information that indicates there is no suitable habitat for this species. On September 28, 2021, USFWS agreed with the No Effect determination for the rufa red knot (**Attachment G**). USFWS recommended a May Affect, Not Likely to Adversely Affect determination for the NLEB after implementation of the mitigation measures discussed above. As such, there would be no adverse impacts on biological resources after mitigation.

An IDNR EcoCAT request was submitted for formal project consultation on November 17, 2021. On November 24, 2021, IDNR determined that impacts would be unlikely with the implementation of mitigation measures. The IDNR EcoCAT request and response are provided in **Attachment G**. For the protection of wildlife associated with Lake Calumet, all lighting would be fully shielded fixtures that emit no light upward. Only "warm-white" or filtered LED (CCT < 3,000 K; S/P ratio <1.2) would be used to minimize blue emission. Only the exact space would be lit with the amount (lumens) needed to meet industry safety requirements. For protection of the osprey, removal of vertical structures such as telephone poles and light poles would be done between November 1 and March 31. If these dates could not be accommodated, a nesting survey would be conducted to determine if species are utilizing structures in the project area. Survey results and methodology will be coordinated with IDNR.

3.3 107th Place Cross-over

This section evaluates and compares impacts resulting from the 107th Place cross-over to those identified in the Draft EIS with no cross-over. **Figure 3-15** shows the UPRR East and West Options from the Draft EIS and the location of the 107th Place cross-over. In the context of this RLE Project, "cross-over" means the crossing of the CTA aerial Red Line structure over the existing at-grade UPRR tracks. The CTA structure would cross over the UPRR tracks with the required vertical clearance underneath for UPRR trains.

Table 3-19 lists those environmental resources that would experience new or different impacts from those identified in the Draft EIS as a result of the 107th Place cross-over. Only two resources would experience impacts not previously disclosed in the Draft EIS.

Table 3-19: 107th Place Cross-over Summary Table of Environmental Resources with New or Different Impacts from Those Identified in the Draft EIS

Environmental Resource	New/Different Impacts from the Draft EIS
Transportation	
Land Use and Economic Development	
Displacements and Relocations of Existing Uses	X
Neighborhoods and Communities	X*
Visual and Aesthetic Conditions	X
Noise and Vibration	
Historic and Cultural Resources	
Hazardous Materials	
Wetlands	
Environmental Justice	
Safety and Security	
Air Quality	
Water Resources	
Biological Resources	
Indirect and Cumulative Impacts	

*Although the Neighborhoods and Communities resource would not experience new or different impacts from those identified in the Draft EIS, the "X" acknowledges that the modification of the Visual and Aesthetic Conditions does affect the community even though it is evaluated as a separate resource.

3.3.1 Displacements and Relocations of Existing Uses

3.3.1.1 Methods

The regulatory framework directing the displacements and relocations of existing uses analysis and the methodology have not changed since the Draft EIS.

3.3.1.2 Existing Conditions

Existing conditions for the 107th Place cross-over are the same as those outlined in the Draft EIS.

3.3.1.3 Environmental Impacts

Permanent Impacts

As **Table 3-20** and **Figure 3-16** show, 10 new (not identified in the Draft EIS) parcels would need to be acquired for the construction of the 107th Place cross-over. The additional parcels would need to be acquired as the aerial crossing over the UPRR tracks would widen the area of potential impact. Construction of the cross-over would directly impact and require the full acquisition of 10 parcels. In addition, the RLE Project would cross over the UPRR right-of-way and require an aerial easement prior to construction.

Four of the property acquisitions would require business or residential relocations. These four parcels are highlighted in **Table 3-20**. Parcels #2 and 3 are buildings in use by F.H. Leinweber Co., a manufacturer and installer of floor underlayments and toppings. As disclosed in the Draft EIS, this property would be acquired for the RLE Project. Parcels #4 and 5 are occupied single-family residences. The remaining six parcels do not require relocation, as they are vacant industrial parcels, or residential parcels that have not had structures on them for several years.

Table 3-20: Parcels to Be Acquired for the 107th Place Cross-over

Parcel ID in Figure 3-16	PIN	Address	Type	Existing Land Use	Future Land Use
1	25-16-307-024	413 W. 107th Street	Full Acquisition	Vacant	Right-of-way
2	25-16-400-070	358 W. 107th Place	Full Acquisition	Industrial	Right-of-way
3	25-16-401-025	363 W. 107th Street	Full Acquisition	Industrial	Right-of-way
4	25-16-411-021	348 W. 109th Street	Full Acquisition	Single Family	Right-of-way
5	25-16-411-022	346 W. 109th Street	Full Acquisition	Single Family	Right-of-way
6	25-16-411-023	342 W. 109th Street	Full Acquisition	Vacant	Right-of-way
7	25-16-411-024	340 W. 109th Street	Full Acquisition	Vacant	Right-of-way
8	25-16-411-025	338 W. 109th Street	Full Acquisition	Vacant	Right-of-way
9	25-16-411-026	334 W. 109th Street	Full Acquisition	Vacant	Right-of-way
10	25-16-411-027	332 W. 109th Street	Full Acquisition	Vacant	Right-of-way

Note: Parcels highlighted have structures on them.

Figure 3-16 depicts the 10 parcels that would be acquired for the cross-over; parcels with no building displacements are depicted in yellow, whereas parcels with building displacements are depicted in green.

Figure 3-16: Displacements in the 107th Place Cross-over Project Area

Property acquisitions would be required. Mitigation measures would be required.

Construction Impacts

Although construction of this cross-over would occur primarily on acquired parcels, it may impact access to some other parcels, limiting their use, including the use of the buildings. There would be displacement or relocation impacts related to construction staging and laydown areas. Mitigation would be required.

3.3.1.4 Mitigation

CTA would work with the property owners to acquire and provide relocation assistance for the parcels needed for the 107th Place cross-over. The Uniform Act would be followed.

Maintenance of traffic plans that maintain access for residents and businesses would be required for the RLE Project. Access may be limited for short periods of time during construction; therefore, a maintenance of traffic plan would be developed prior to construction. Alternate access would be identified, signage used during construction to route drivers, and changes in access regularly communicated to property and business owners.

There would be no adverse impacts on displacements due to the 107th Place cross-over after mitigation.

3.3.2 Visual and Aesthetic Conditions

3.3.2.1 Methods

The regulatory framework directing the visual and aesthetic conditions analysis and the methodology have not changed since the Draft EIS.

3.3.2.2 Existing Conditions

The land uses in the area immediately adjacent to the cross-over are industrial, residential, and vacant. Existing views of the cross-over area from adjacent streets include tree-lined railroad tracks and industrial buildings.

3.3.2.3 Environmental Impacts

Permanent Impacts

The visual environment that would be impacted by the 107th Place cross-over includes areas that would have a view of the new facilities and areas visible from the new facilities. Impacts could include shadows from the structures, vegetation removal, and change in visual setting.

The removal of vegetation for the elevated structure would alter the viewshed of the remaining residences. **Photograph 3-7** shows existing conditions and a photo simulation of the 107th Place cross-over. The residential character and scale would be substantially altered by the addition of the elevated structure. The elevated structure would be approximately 48 feet high (existing grade to top of rail) to provide the required clearance over the UPRR tracks. The height of the elevated structure in the Draft EIS for either the East or West Options was approximately 23 feet high (existing grade to top of rail). **Photograph 3-8** shows the existing conditions and photo simulation of the 107th Place cross-over from 108th Street.

Because of the height of the elevated 107th Place cross-over, the existing vegetation would not effectively block the views from adjacent residences, permanently changing the visual setting of the area. There would be high and adverse visual and aesthetic impacts on the residential neighborhood on the east of the UPRR tracks from the construction of the 107th Place cross-over.

In the area of 107th Place, there were low and moderate impacts identified in the Draft EIS. Because impacts on visual and aesthetic conditions identified in this Supplemental EA would be high as a result of the structure elevation and the inability for the existing vegetation to block the views, impacts in this Supplemental EA would be considered higher than those identified in the Draft EIS.

Construction Impacts

Construction impacts from the 107th Place cross-over on visual and aesthetic conditions would be the same as those described in the Draft EIS. There would be no new construction impacts on visual and aesthetic conditions.

3.3.2.4 Mitigation

Mitigation measures would include landscaping, using urban design techniques to reduce massing. Techniques that may be used include planting larger trees near structures to break the sight lines, with smaller-scale landscaping near the streets. Mitigation measures would reduce the impacts on visual and aesthetic conditions. However, due to the proximity and height of the elevated structure to residential areas, impacts on visual and aesthetic conditions would remain high and adverse after mitigation. Note that appearance of project elements and residences in visualizations in **Photographs 3-7** and **3-8** is intended to show the scale of project elements. Actual construction appearance may differ based on design decisions for colors, textures, finishes, and choice of specified design features.

Chapter 4 Section 4(f) Evaluation

Section 4(f) of the USDOT Act of 1966 is a federal law that establishes requirements for USDOT (including FTA) consideration of publicly owned parks/recreational areas that are accessible to the general public, publicly owned wildlife/waterfowl refuges, and publicly or privately owned historic sites of federal, state, or local significance in developing transportation projects. This law, commonly known as Section 4(f), is now codified in 49 USC § 303 and 23 USC § 138 and is implemented by FTA through the regulation 23 CFR Part 774. Additional guidance on the implementation of Section 4(f) may be found in Federal Highway Administration's Section 4(f) Policy Paper (FHWA 2012). FTA has formally adopted this guidance and this analysis was conducted consistent with this guidance.

Publicly owned park or recreation land and historic sites were evaluated in the Draft EIS and discussed in the Chapter 8 - Section 4(f) Evaluation. There are no changes in the methods used for the identification, analysis, and evaluation of Section 4(f) resources for the Supplemental EA. This chapter addresses changes to Section 4(f) resources based on the 130th Street station relocation. No Section 4(f) resources were identified in the project areas for the 120th Street yard and shop refinement and the 107th Place cross-over.

4.1 Section 4(f) "Use" Determinations

To determine whether Section 4(f) applies to the proposed project and as defined in 23 CFR § 774.17, the protected Section 4(f) properties must be assessed to determine whether there would be a "use" of the property as defined in the statute. Per the regulation, use of a protected Section 4(f) property occurs when any of the following conditions are met:

1. **Permanent Incorporation/Direct Use** - A permanent incorporation or direct use of a Section 4(f) property occurs when land is permanently incorporated into a transportation facility. *"Permanent incorporation"* of a Section 4(f) property would include purchasing part or all of the property for use as right-of-way or for transportation facilities or purchasing a permanent easement for construction or operations. Even small partial acquisitions of Section 4(f) lands are considered permanent incorporation.
2. **Temporary Use** - A temporary use of a Section 4(f) property occurs when there is a short-term use of the property that is considered adverse in terms of the preservation purpose of the Section 4(f) statute. Under 23 CFR § 774.13, a temporary occupancy of a property does -not constitute a "use" of a Section 4(f) property when all of the following conditions are satisfied:

   - The duration is temporary (i.e., less than the time needed for construction of the project), and there is no change in ownership of land.

- The scope of work is minor (i.e., both the nature and magnitude of the changes to a Section 4(f) property are minimal).
- There are no anticipated permanent adverse physical impacts, nor is there interference with the protected activities, features, or attributes of the property, on either a temporary or permanent basis.
- The land being used is fully restored to a condition that is at least as good as that which existed before the project.
- There is documented agreement among appropriate federal, state, and local official(s) with jurisdiction over the Section 4(f) property regarding the above conditions.

3. **Constructive Use** - A constructive use of a Section 4(f) property occurs when a transportation project would not incorporate land from the property, but the proximity of the project would result in impacts so severe that the protected activities, features, or attributes that qualify the property for protection under Section 4(f) would be substantially impaired (23 CFR § 774.15).

4.2 Section 4(f) Approval Options

FTA may not approve the use of a Section 4(f) property, unless it determines the following, as defined in 23 CFR § 774.17:

- There is no feasible and prudent alternative to the use of that land and the project includes all possible planning to minimize harm of using the property.

OR

- FTA determines that Section 4(f) use of the property would have a "*de minimis*" impact.

Feasible and prudent standards for evaluating avoidance alternatives to using Section 4(f) property are defined in 23 CFR § 774.17. If it is ultimately determined no feasible and prudent avoidance alternative exists, then the alternative with the least overall harm to Section 4(f) properties must be selected. Seven factors, which are established in 23 CFR § 774.3(c)(1), are used to determine which alternative would incur the least overall harm to Section 4(f) properties.

Alternatively, the requirements of Section 4(f) are satisfied with respect to a Section 4(f) property if it is determined by FTA that a transportation project would have a "*de minimis*" impact on the Section 4(f) property.

A *de minimis* impact is defined in 23 CFR § 774.17 as follows:

- For historic sites, a *de minimis* impact means that FTA has determined, in accordance with 36 CFR § 800, that either no historic property would be affected by the project, or the project would have "no adverse effect" on the property in question. The official with jurisdiction must be notified that FTA intends to make a *de minimis* finding based on their concurrence with the "no adverse effect" determination under 36 CFR § 800. This is usually done in the effect determination letter sent to the official with jurisdiction for their concurrence.
- For parks, recreation areas, and wildlife/waterfowl refuges, a *de minimis* impact is one that would not adversely affect the features, attributes, or activities qualifying the property for protection under Section 4(f), and the official with jurisdiction has concurred with this determination after there has been a chance for public review and comment.

If an alternative is found to use Section 4(f) properties, a *de minimis* finding can be made for direct uses or temporary uses that do not adversely affect the activities, features, or attributes that make the property eligible for Section 4(f) protection. The provision allows avoidance, minimization, mitigation, and enhancement measures to be considered in making the *de minimis* determination.

Projects determined to have *de minimis* impacts on Section 4(f) properties may proceed without needing to make a determination that no feasible and prudent avoidance alternatives exist. The officials with jurisdiction must concur in writing with a *de minimis* finding. For parks, recreational areas, or wildlife or waterfowl refuge properties, concurrence from the officials having jurisdiction over the properties is required. For historic sites, concurrence from the SHPO on FTA's "No Adverse Effect" determination is required.

4.3 Historic and Archaeological Resources

4.3.1 Identification of Historic and Archaeological Resources

At the 130th Street station area, 60 historic properties, including the Carver Military Academy High School, were recorded within the APE. Fifty-nine historic properties are contributing to the Altgeld Gardens – Philip Murray Homes National Register Historic District. **Table 3-8** in **Section 3.1.7** lists these historic properties. NRHP status of these historic properties was confirmed with consulting parties and SHPO on March 18, 2021. Since that time, refinements have been made by CHA to their NRHP eligibility criteria. These refinements were submitted with the draft *Section 106 Effects Report* and confirmed by consulting parties and SHPO on July 9, 2021. **Table 3-9** in **Section 3.1.7** lists a summary of effects for all historic properties in the RLE Project APE. No adverse effects to these historic properties would occur as a result of the RLE Project.

4.3.2 Section 4(f) Use Assessment – Historic and Archaeological Resources

All 60 of the individual historic properties, including the Carver Military Academy High School, are located outside of the 130th Street station relocation area. Based on the proposed boundary for the Altgeld Gardens-Philip Murray Homes (AGPMH) National Register Historic District (**Figure 3-9**), the historic district is also outside of the 130th Street station relocation area. The project proposes no physical changes to geometry or location of streets that fall within the AGPMH Historic District; however, the project would increase traffic along Greenwood Avenue that serves as the primary entrance to the park & ride facility, other structures, and station. Greenwood Avenue is included within the AGPMH Historic District as the easternmost boundary. The project has been designed to minimize the increase in traffic on roads within the historic district, as discussed in **Section 3.1.7**. There are five intersections within the historic district. These unsignalized intersections continue to operate at a level of service (LOS) A in the 2050 Build Alternative. **Table 3-4** in **Section 3.1.1.3** lists the intersection LOS for the intersections within the project area. Increased traffic along Greenwood Avenue does not rise to the level of an adverse effect. As such, there would be no permanent or constructive use of any historic properties and no further Section 4(f) analysis is required. In a letter dated July 9, 2021, SHPO stated the need for additional information to evaluate effects on the historic properties near 130th Street station. After a meeting between CTA, FTA, and SHPO on July 26, 2021 and additional follow-up materials provided to SHPO for evaluation, SHPO provided parameters for a finding of no adverse effect on August 10, 2021. The *Section 106 Final Effects Report* was revised to incorporate this changed information and was sent to consulting parties for final review and comment from September 13 to September 27, 2021. No comments were received during this time.

4.4 Parks, Recreation, and Wildlife/Waterfowl Refuge Resources

All public parks and recreational properties within 500 feet of the proposed right-of-way area and within ½ mile of the 130th Street station were analyzed for further evaluation of potential Section 4(f) use (**Table 4-1**).

4.4.1 Identification of Section 4(f) Resources

There are two recreational facilities within ½ mile of the 130th Street station relocation area: George Washington Carver Park and Beaubien Woods Forest Preserve. See **Figure 3-4** for park and open space land uses within the relocation station area.

George Washington Carver Park

George Washington Carver Park is a 19-acre park with a gymnasium, indoor swimming pool, fitness center, boxing ring, and multipurpose clubrooms. These indoor park facilities are located within the Altgeld Gardens neighborhood, over 1,400 feet west of the southern end of the 130th Street station relocation. The park also has a playground, baseball diamonds, basketball courts, and picnic groves. The park playground is located adjacent to George Washington Carver Primary School, approximately 1,600 feet west of the 130th Street station relocation. George Washington Carver Park is owned by CPD (CPD 2021). **Photograph 4-1** shows the playground near 133rd Street and Ellis Avenue.

Carver Park

Photograph 4-1: View Looking Southwest from 133rd Street of Playground Area in Carver Park

Beaubien Woods Forest Preserve

The Beaubien Woods Forest Preserve is a 279-acre forest preserve, containing a mix of prairie, woodland, and wetland habitats. Flatfoot Lake is also within the preserve. Activities in the preserve include kayaking, bird watching, and picnicking. A boat launch area connecting to the Little Calumet River is located within the forest preserve. **Photographs 4-2** through **4-6** show some of the amenities at Beaubien Woods Forest Preserve. The northern end of the Beaubien Woods Forest Preserve is a linear green space that parallels the Conrail tracks from just south of Old 130th Street to 132nd Street. This linear green space is open space except for an access road, which runs the length of the property. There are no other amenities (i.e., benches, monuments, picnic pavilions). It is used for passive recreation. The Beaubien Woods Forest Preserve is owned by FPCC (FPCC 2020b).

Photograph 4-2: View Looking Northwest of the Linear Green Space and Access Road, approximately 650 feet North of 132nd Street within the Beaubien Woods Forest Preserve

Beaubien Woods Boat Launch

Photograph 4-5: Entry to the Beaubien Woods Boat Launch South of 132nd Street

Photograph 4-6: Boat Launch Area at the Beaubien Woods Forest Preserve

4.4.2 Section 4(f) Use Assessment

Identified park, recreation and wildlife/waterfowl refuges were evaluated to determine whether there would be a use under Section 4(f) of these resources. **Table 4-1** summarizes the Section 4(f) use assessment findings of this analysis, which are further discussed below.

Table 4-1: Park and Recreational Properties Evaluated for Section 4(f) Use

Park or Recreational Property Name	Address	Section 4(f) Use
		130th Street Station
George Washington Carver Park	939 E. 132nd Street	No Use
Beaubien Woods Forest Preserve	1 W. Doty Avenue South	No Use

George Washington Carver Park

There would be no Section 4(f) use of George Washington Carver Park permanently or during construction. This park would not be used by the RLE Project; there would be no indirect impacts on George Washington Carver Park. No further Section 4(f) evaluation is required.

Beaubien Woods Forest Preserve

From the north going south, the RLE alignment would cross over Old 130th Street at-grade, then continue southeast toward 132nd Street. The closure of Old 130th Street would eliminate a connection to the access road into the Beaubien Woods Forest Preserve from Old 130th Street (**Photograph 4-7**). The main access road to the Beaubien Woods Forest Preserve and the boat launch would continue to be from Ellis Avenue to Greenwood Avenue to 132nd Street. The property lines, as provided by the Cook County Assessor's office, show that a section of 132nd Street is within FPCC-owned land. The 130th Street station and tracks would not use the FPCC-owned land.

CTA held an early coordination meeting with FPCC in December 2019 to discuss the potential of moving the 130th Street station south and to better understand amenities, features, and attributes of the linear parcel adjacent to the RLE Project. Opportunities for improvements and additional connections were discussed at this meeting and through subsequent coordination meetings with FPCC. Moving the 130th Street station south of 130th Street would improve transit access and pedestrian connections to the Beaubien Woods Forest Preserve and its amenities. The station relocation would open up opportunities to create a gateway to the Beaubien Woods Forest Preserve from the rest of the city and surrounding suburbs through direct connection to the rail transit network through a new station, enhanced bus service connections at the station, and a proposed park & ride facility directly adjacent to the forest preserve. The station area improvements would also provide connections to existing and proposed bikeways within the RLE project area.

At this time, FPCC has indicated that the closure of Old 130th Street would diminish access to the boat launch from the north and are concerned about noise and vibration impacts to the forest preserve land immediately adjacent to the proposed 130th Street station.

A noise and vibration analysis was completed as part of the Supplemental EA and resulted in no noise and vibration impacts. Details of the noise and vibration analysis can be found in **Section 3.1.6**. CTA has coordinated and continues to coordinate with FPCC to mitigate the closure of the secondary access point to Beaubien Woods Forest Preserve and address any potential noise and vibration impacts. Documentation for the Section 4(f) coordination can be found in **Attachment H**.

Photograph 4-7: View Looking South from Old 130th Street at FPCC Access Road

The main access road to Beaubien Woods Forest Preserve boat launch is south of 132nd Street and would remain. FPCC has recently improved the access road (summer 2020) south of 132nd Street and reconstructed the parking lot for the boat launch area. The access north of 132nd was not improved. The most direct route to the boat launch from the north would be provided from Ellis Avenue to Greenwood Avenue to 132nd Street, then continuing south on the access road to the boat launch. An alternate route could be from Ellis Avenue to Greenwood Avenue, perform a U-turn back to Old 130th Street, travel east to the FPCC access road and continue south to the boat launch. The barrier median at Ellis Avenue and Old 130th Street prevents a direct left turn maneuver from Ellis Avenue to Old 130th Street, requiring the U-turn at Ellis Avenue and Greenwood Avenue to continue east on Old 130th Street. To return to 130th Street from the boat launch, the route would be traveled in reverse along 132nd Street to Greenwood Avenue to Ellis Avenue. The route is along public roadways north of 132nd Street.

Mitigation measures would be implemented to minimize impacts to the FPCC-owned land due to the elimination of the Old 130th Street connection, and therefore, there would be no Section 4(f) use of the property. **Attachment H** includes the letter of concurrence that CTA sent to FPCC on August 19, 2021 regarding mitigation measures detailed in the FPCC May 13, 2021 memorandum, according to 23 CFR § 774.15(d)(3).

The mitigation and enhancement measures proposed include the following:

- Transfer of two-City owned parcels into FPCC ownership
- $250,000 payment to FPCC for ecological restoration, habitat enhancement, and beautification of expanded Beaubien Boat Launch land
- New trail connection from Altgeld Gardens recreation facilities on 133rd Street to the Beaubien Woods Boat Launch
- Wayfinding and information signage inside the proposed station and outdoor signage at 130th Street and Ellis Avenue and other locations
- Forest Preserve advertising to encourage CTA riders to use public transportation to visit the Forest Preserves at the 130th Street station, other Red Line stations south of Roosevelt, and inside local trains and busses.

The mitigation measures may be modified based on continuing coordination with the FPCC and the City regarding the two-City owned parcels. The mitigation measures will be shared with the public for review and comment as part of the publication of the Supplemental EA.

Based on the results from these coordination activities, in the Final EIS and ROD, FTA will confirm and finalize the findings by reference to the documentation included in this Supplemental EA. Concurrence from FPCC, as the agency with jurisdiction over Section 4(f) properties evaluated in this chapter, is required to confirm these results. Correspondence from FPCC confirming FTA's determinations will be included in the Final EIS.

Chapter 5 Public Involvement and Agency Coordination

This chapter and the Public Outreach **Attachment I** document outreach activities that FTA and CTA have undertaken for the RLE Project and focuses on the outreach conducted between the development and announcement of the Preferred Alignment in 2018 and the publication of this Supplemental EA. Summaries of past public and agency coordination meetings can be found in the Draft EIS. A summary of activities is provided in the following sections.

5.1 Public Outreach

Community outreach for the RLE Project has continued since the announcement of the Preferred Alignment and will continue through this Supplemental EA and the Final EIS phases. CTA will continue to involve and consult the community as the RLE Project proceeds through design.

In an effort to further engage and seek support from a comprehensive group of community members who are seen as invested stakeholders within the RLE footprint, the RLE Project Advisory Council (PAC) was formed in 2019. The PAC is made up of 20 community and governmental organizations, with approximately 24 representatives. The PAC aims to meet quarterly.

Other public outreach activities include the issuance of newsletters, mailers (U.S. Postal Service mailings and hard copy drop-offs), a digital engagement platform (Bang the Table), regular postings on a RLE Project Facebook page, eBlasts (i.e., mass emails sent to people who signed up for RLE Project notifications), and announcements regarding the RLE Project. **Attachment I** contains copies of public outreach materials that have been issued for the RLE Project since the summer of 2020. Because of the COVID-19 pandemic, virtual adaptations and virtual meeting accommodations were used instead of in-person meetings and gatherings starting in the spring of 2020. Virtual community organization, stakeholder, and public meetings allowed the participants to provide input, ask questions, share their comments, and discuss any concerns with CTA. A community organization refers to a local organization with interest in improving services and providing additional opportunities for the community. Stakeholders are members of groups or parties with an interest in the project (e.g., FPCC). Public refers to the general audience who may directly benefit from a project (e.g., residents, local business owners).

CTA continues to update the project website (https://www.transitchicago.com/rle/), which serves as the most up-to-date source of information for the public. CTA also conducted individual and group briefings for elected and public officials; community, civic, business, and religious leaders; and other stakeholders, providing them the opportunity to comment and inquire about the RLE Project.

Table 5-1 shows the community organizations and stakeholders with whom CTA conducted meetings and the dates of these meetings. **Table 5-1** also shows the public meetings conducted for this Supplemental EA and the dates of these meetings. **Attachment I** presents summaries of these meetings.

Table 5-1: Outreach Meetings Held to Date

Community Organization, Stakeholder, or Public Meeting	Date
Preferred Alignment Announcement	
Displacements Community Meetings	February 6 and 8, 2018
Open House	February 13, 2018
130th Street Station Relocation	
Altgeld Temporary Advisory Committee (TAC)	December 16, 2019
Carver Military Academy High School Governing Board	February 3, 2020
Golden Gate Homeowners Association	February 11, 2020
Carver Park Advisory Council	February 13, 2020
People for Community Recovery	February 20, 2020
Local Advisory Council Altgeld Murray and TCA Health	February 25, 2020
Supplemental EA	
Community Meetings	December 8 and 9, 2020
Altgeld TAC	January 25, 2021
130th Street Station Area Meeting	January 27, 2021
111th Street Station Area Meeting	February 2, 2021
103rd Street Station Area Meeting	February 9, 2021
Michigan Avenue Station Area Meeting	February 16, 2021

5.1.1 Preferred Alignment Announcement

CTA conducted public and agency outreach efforts for the selection of the Preferred Alignment, including displacement-specific outreach to property owners and residents who would potentially be displaced by the RLE Project. Displacements community meetings were conducted on February 6 and 8, 2018. CTA held an open house on February 13, 2018. **Attachment I** provides a summary of the public outreach activities that occurred for the Preferred Alignment (i.e., Preferred Alignment Announcement, Public Open House, and Displacements Outreach Summary, dated November 2018).

5.1.2 130th Street Station Relocation

CTA held meetings with partner agencies and stakeholder groups of residents in and near the proposed station relocation area (**Table 5-1** and **Attachment I**). The goal was to present the opportunity to relocate the terminal station south of 130th Street and solicit feedback from the public and organizations. CTA conducted briefings for elected officials on the proposed station relocation.

5.1.3 Supplemental EA

CTA conducted the first round of community meetings for the Supplemental EA on December 8 and 9, 2020. Because of the COVID-19 pandemic, virtual adaptations and virtual meeting accommodations were met through the Zoom webinar platform with a telephone dial-in option and Facebook Live. CTA solicited input and provided two-way communication through polling questions, a chat window, and a Question-and-Answer (Q&A) window.

The community meetings were ADA accessible. The virtual community meetings were publicized by flyer, postcard notice, newspaper advertisements, eBlasts (mass emails), customer alerts, and on the project website. For individuals needing the assistance, Spanish interpreters and American Sign Language interpreters were available for the entirety of the virtual community meetings. Closed captioning was also offered.

Community members in attendance submitted questions through the chat and Q&A windows regarding project funding, frequency of bus service, location of parking lots and sizes, noise and vibration during construction, employment opportunities for community members, inclusion of local design/artists in project design, and potential for TOD. CTA staff provided answers to the posted questions through the chat and Q&A windows.

Station area specific meetings were held in January and February of 2021. Two Altgeld TAC meetings were held on December 16, 2019 and January 25, 2021. The Altgeld TAC meetings solicited input and provided information to its members about topics and concerns specific to 130th Street station and Altgeld Gardens neighborhood. The specific meetings dates for each station and the TAC meetings are presented in **Table 5-1**. **Attachment I** presents summaries of these meetings.

5.2 Agency Coordination

CTA has conducted and continues to coordinate with governmental and other agencies throughout the course of this RLE Project. Outreach efforts were conducted in compliance with NEPA and other applicable regulations, including Section 106 of the NHPA, Section 4(f) of the

USDOT Act of 1966, joint guidance and regulations from FTA and FHWA, and other agency regulations and guidance.

5.2.1 Section 106 Coordination

The Section 106 consultation process established from the Draft EIS has been followed for the design changes presented in this Supplemental EA. In November 2020, CTA and FTA sent invitation letters to 11 consulting parties that were not included in the Section 106 consultation for the Draft EIS. In April 2021, CTA sent an invitation letter to one additional consulting party. Invitation letters from CTA and FTA sent to consulting parties are in **Attachment D**. In February 2021, the Greater Roseland Chamber of Commerce contacted CTA with a request to participate in the Section 106 process as a consulting party. This request was accepted by CTA and FTA. A total of 22 new and returning organizations accepted participation as consulting parties for this project. FTA and CTA sought information from individuals and organizations likely to have knowledge of local potential resources. Details of the consulting parties contacted can be found in **Section 3.1.7** and **Attachment D**. Consultation meetings focused on project design changes since the previous consultation that was conducted during the Draft EIS which included updates to the APE, eligibility review, and effects discussions. The first consulting party meeting was held February 18, 2021. The second consulting party meeting was held June 30, 2021. A breakout meeting was held between CTA, FTA, and SHPO on July 26, 2021 to address SHPO response to the draft *Section 106 Effects Report*. **Attachment D** contains copies of correspondence and Section 106 consultation materials.

5.2.2 Section 4(f) Coordination

CTA has coordinated with the FPCC due to the 130th Street station location adjacent to Beaubien Woods Forest Preserve, a Section 4(f) property. Coordination activities are discussed in **Section 4.4.2**. Documentation for the Section 4(f) coordination can be found in **Attachment H**. The Section 106 consulting party meetings discussed in **Section 5.2.1** also serve as part of the Section 4(f) public involvement and agency coordination process.

CTA will continue to coordinate with the FPCC regarding potential impacts and mitigation measures to Beaubien Woods Forest Preserve.

5.2.3 Coordination with Other Federal, State, and Local Agencies

CTA continues to coordinate with agencies and jurisdictions that have been involved with the RLE Project and continue to be involved through the NEPA and engineering phases. Coordination with the agencies will continue through the Supplemental EA process to the Final EIS.

5.3 Public Hearing, including Section 4(f) Outreach

The Supplemental EA serves as the primary document to facilitate review by agencies and the public regarding the design changes that have occurred for the RLE Project since the Draft EIS including the 130th Street station relocation, 120th Street yard and shop refinement, and the 107th Place cross-over. CTA has established a 30-day comment period to take formal comments on the Supplemental EA, consistent with 23 CFR 771.119. The Supplemental EA is available on the CTA website (https://www.transitchicago.com/RLE/SEA), and hard copies of the Supplemental EA are available at the following locations during the public review period:

- Federal Transit Administration – Region 5 Office, 200 W. Adams Street, Suite 320, Chicago, IL, 60606
- CTA headquarters, 567 W. Lake Street, 2nd Floor, Chicago, IL 60661
- Pullman Public Library, 11001 S. Indiana Avenue, Chicago, IL 60628
- West Pullman Public Library, 830 W. 119th Street, Chicago, IL 60643
- Altgeld Public Library, 955 E. 131st Street, Chicago IL 60827
- Woodson Regional Public Library, 9525 S. Halsted Street, Chicago, IL 60628
- Calumet Park Public Library, 1500 W. 127th Street, Calumet Park, IL 60827
- Harold Washington Library Center, 400 S. State Street, Chicago, IL

The public hearing will be held in two formats: one virtual meeting and one in-person meeting. The virtual hearing will be on February 15, 2022 from 6:00 to 8:00 PM. The in-person hearing will be held at The Salvation Army Kroc Center, 1250 W. 119th Street, Chicago, IL 60643 on February 17, 2022 from 6:00 to 8:00 PM. Each public hearing will solicit comments from agencies and the community about findings presented in the Supplemental EA. The virtual hearing will be ADA accessible, including closed captioning and Spanish and American Sign Language interpreters. The in-person hearing will be conducted in an open house format and will be ADA compliant.

Comments on the Supplemental EA will be accepted from January 31, 2022 to March 1, 2022. Comments received during the public hearing will be reviewed by FTA and CTA and will be entered into public record. A summary of the public hearing and responses to comments received will be included in the Final EIS.

▨ Red Line Extension Project Footprint
🟫 Displaced Building
🟦 Affected Parcel

Parcels and buildings that may be displaced are shown to illustrate maximum impacts and possible locations. Due to final refinements as project engineering progresses, the actual displacements for the Preferred Alignment may vary from what is shown. Some of the properties shown may not ultimately need to be acquired. Land only property impacts are shown on the entire lot, however, often only portions of the lot would be required. Property acquisitions will be confirmed as project engineering progresses.

Attachment C – Transportation

Red Line Extension Traffic Methodology:

Existing Traffic Volumes

Historic traffic volumes for the 130th Street and Ellis Avenue intersection and the 130th Street at I-94 ramps were compared to their 2020 traffic volumes to determine if traffic volumes were affected by the COVID-19 pandemic. The comparison of data determined that additional factors outside population growth impacted traffic volumes, and that the COVID-19 pandemic had affected transportation patterns. The 2020 traffic data was collected on September 1 and 2, 2020 using video traffic and turning movement counts during the AM and PM period for the 130th Street and Ellis Avenue intersection and the I-94 ramps. For comparison of the 2020 volume data, the intersection of 130th Street and Ellis Avenue used 2012 historic traffic data from the Draft EIS, whereas the I-94 ramps used a combination of 2018 and 2019 historic traffic data, based on availability from IDOT. For these two locations, the pandemic's effect on traffic has led to a much greater reduction in traffic in the AM and a modest increase in traffic in the PM, compared to historic traffic. As a result of CTA's coordination with IDOT, it was agreed upon to use historic volumes for the 130th Street and Ellis Avenue intersection as existing traffic volumes. For the I-94 ramps, the higher of the two volumes between the 2020 counts and the historic data for each ramp was chosen as the existing traffic volume for the Project.

The Altgeld Gardens neighborhood intersections did not have historic data available for comparison. Instead, a separate AM and PM growth factor based on historic traffic volumes from the 130th Street and Ellis Avenue intersection was applied to account for the variation of transportation patterns resulting from the pandemic. The traffic volumes that were established using historic volumes with growth factors were used as the existing traffic volumes at the Altgeld Gardens neighborhood intersections.

2050 No-Build Traffic Volumes

CTA used data from CMAP's 2050 Regional Travel Demand model to develop "no-project" intersection-level traffic projections. These "no-project" traffic projections accounted for the background growth in traffic due to additional regional and subregional land use development and population growth. The traffic projections include any mode shifts from vehicles to transit as a result of the future implementation of a modern, multimodal system that adapts to changing travel demand as part of the *ON TO 2050*. CTA determined the background growth of traffic for roadway segments using the data from the regional travel demand model. Average annual traffic growth for roadway segments ranged from 0 to 0.4 percent. These growths were used to calculate the 2050 No-Build traffic volumes.

2050 Build Traffic Volumes

The Build Alternative-generated trips were added to the No Build traffic volumes to develop the 2050 Build traffic volumes. The trip generation is based on the Simplified Trips-on-Project

Software (STOPS) analysis and data from similar sized existing CTA parking facilities. STOPS is a trip modeling software used to estimate future ridership for transit projects. The software provides station mode-of-access numbers, including estimates of those driving to the new stations. These estimates feed into the traffic analysis. STOPS is used nationally and is recommended for use in trip modeling by FTA. The STOPS analysis was run for both an existing year (2017), to serve as a baseline, and future year (2037) condition. The park & ride-generated trips for 2037 will be valid for 2050 because those trips are constrained by parking capacity. The 2050Build traffic volumes were calculated using the 2050 No Build traffic volumes plus the traffic generation volumes from the 2037 STOPS analysis.

Synchro and HCS Analysis

An analysis of existing traffic volumes, 2050 No-Build traffic volumes, and 2050 Build traffic volumes was performed using Synchro 10 at the intersections and Highway Capacity Software (HCS) at the I-94 ramps. The results of the Synchro and HCS analysis were used to determine which intersections were impacted by the additional traffic caused by background growth and station traffic. For this Supplemental EA, a traffic (i.e., passenger or freight vehicle) impact is defined by degradation in peak-hour Level of Service (LOS) at any intersection within the project area. CTA coordinated with IDOT and CDOT regarding LOS thresholds, and for this analysis, a change in intersection LOS from LOS A, B, C, or D under the No Build Alternative to LOS E or F under the Build Alternative would result in an adverse impact and operational or physical improvements were agreed to be identified in analyzing impacts where LOS degradation would occur between future No Build and Build Conditions. Instances where storage capacity for turning lanes was not adequate for vehicle traffic based on the IDOT red time queue formula would also warrant recommended improvements to be incorporated by CTA as mitigation measures to prevent adverse impacts to the roadway operations. CTA identified mitigation measures to reduce the impacts to a more acceptable LOS for adverse impacts caused directly by Project facilities, when those impacts would not be offset by the additional transportation benefits provided by the Project.

Attachment C includes Synchro and HCS summary sheets which includes all the volume and geometric inputs for each intersection along with the traffic analysis results including, delay, density, queue length, and LOS.

ELEMENTS CONTROLLING DESIGN

PREFERRED ROUTE:

F.A.U. ROUTE NUMBER: 344. MARKED ROUTE NUMBER: N/A.
STREET NAME: 130TH STREET. SRA ROUTE: N.
FUNCTIONAL CLASSIFICATION: PRINCIPAL ARTERIAL. OSOW DESIGN: Y.
EXISTING ADT: 18,200 VPD (2018).
DESIGN YEAR ADT: 25,300 VPD (2050).
PROPOSED DESIGN SPEED: 40 MPH. PROPOSED POSTED SPEED: 35 MPH.

SECONDARY ROUTE:

F.A.U. ROUTE NUMBER: N/A. MARKED ROUTE NUMBER: N/A.
STREET NAME: COTTAGE GROVE AVENUE (N)/ELLIS AVENUE (S). SRA ROUTE: N.
FUNCTIONAL CLASSIFICATION: LOCAL ROAD. OSOW DESIGN: N.
EXISTING ADT: 2,000 VPD (2018). DESIGN YEAR ADT: 6,000 VPD (2050).
PROPOSED DESIGN SPEED: 25 MPH. PROPOSED POSTED SPEED: 20 MPH.

IMPROVEMENT TYPE: WIDEN/RECONSTRUCTION. ANTICIPATED YEAR OF CONSTRUCTION: 2025.
EXISTING METHOD OF TRAFFIC CONTROL: SIGNALIZED. PROPOSED METHOD: SIGNALIZED.
SIGNAL WARRANT: EXISTING SIGNAL.
DESIGN VEHICLE: S-BUS-40 AND WB-65.
DESIGN YEAR: 2050 WHICH IS A 20 YEAR DESIGN.
TRUCK ROUTE DESIGNATION: PREFERRED ROADWAY: NONE.
SECONDARY ROADWAY: NONE.
DESIGN CRITERIA: BDE CHAPTER 36.

GENERAL NOTES

ARE PROFILES PROVIDED: NO, SLOPE OF ROADWAY IS < 1%
TYPE B-6.24 CURB AND GUTTER ON THE OUTSIDE OF THE ROADWAY/SHOULDERS.
TYPE B-6.24 CURB AND GUTTER ON THE CORNER ISLANDS.
ALL DIMENSIONS ARE E-E, UNLESS OTHERWISE NOTED.
THE RIGHT-OF-WAY LIMITS ARE PRELIMINARY.
DESIGN VEHICLE TURNING MOVEMENTS ARE ACCOMMODATED PER AUTOTURN SOFTWARE, VERSION 9.1.

THE SCOPE OF WORK: EXTENSION OF WESTBOUND LEFT TURN LANE AND EASTBOUND RIGHT TURN LANE.

INTERSECTION DESIGN EXCEPTIONS: WB LEFT TURN LANE: UNSHADOWED TURN LANE; NB THROUGH-RIGHT TURN MOVEMENT (AM) LOS D (POLICY VALUE LOS C)

ADDITIONAL NOTES: THE INTERSECTION IS NOT A 5% LOCATION. THE INTERSECTION IS NOT PART OF AN INTERCONNECTED SYSTEM.

Adjustment of 2020 Collected Traffic Data under COVID-19 Pandemic Conditions for Altgeld Gardens

November 30, 2020

To: CTA RLE Team

From: TranSmart

Re: Adjustment of 2020 Collected Traffic Data under COVID-19 Pandemic Conditions for Altgeld Gardens

Background:

Traffic counts were conducted within Altgeld Gardens to obtain data for use in the traffic analysis of the relocated 130th Street station within Altgeld Gardens. The analysis will be part of the Supplemental Environmental Assessment (EA) evaluating the new location of the 130th Street station. Seven locations within Altgeld Gardens were counted. **Figure 1** in the Appendix shows a map of these locations.

1. Old 130th Street and Ellis Avenue
2. Greenwood Avenue and Ellis Avenue
3. Greenwood Avenue and 130th Place
4. Greenwood Avenue and 131st Street
5. Greenwood Avenue and 132nd Street
6. Beaubien Woods and 132nd Street
7. Doty Avenue and 132nd Street

Traffic counts were conducted on October 7 and 8, 2020 using Miovision cameras and manual counters. The counts were observed from 7:00 AM to 9:00 AM for the morning peak and from 4:00 PM to 6:00 PM for the afternoon peak.

The Chicago Department of Transportation (CDOT) and the Chicago Housing Authority (CHA) were queried and no historical traffic data was available within Altgeld Gardens for comparison. The lack of historical data required that adjustments be made to the collected 2020 Altgeld Gardens traffic data to account for effects of the COVID-19 pandemic before the data could be used in the analysis. Adjustment factors would need to be developed and applied to make it consistent with the available historical traffic data utilized at the 130th Street intersection.

Volume Adjustments:

The growth factor applied to the Altgeld Gardens turning movement counts was calculated from the total volume of inbound and outbound traffic on the south leg of the 130th Street and Ellis

Avenue intersection. The south leg of 130th Street and Ellis Avenue was used to calculate the growth factor because it is the main entrance to the Altgeld Gardens development, serving as a desirable representative for the Altgeld Gardens intersections. The growth factor was the percentage difference between the collected 2020 traffic data and historical traffic data. A separate growth factor was calculated for the AM and PM peak hours. A growth factor of 1.93 and 0.81 was calculated for the AM peak hour and PM peak hour, respectively. Since the growth factor in the AM is greater than 1.00 and the growth factor in the PM is less than 1.00, the adjusted volumes in the AM will be greater than the 2020 volumes collected and the adjusted volumes in the PM will be less than the 2020 volumes collected.

Table 1 in the Appendix has the individual turning movements for the Altgeld Gardens intersections for the AM and PM peaks. These turning movements include the collected 2020 traffic data and the adjusted 2020 traffic data, where the AM and PM growth factor were applied. The adjusted volumes for the seven intersections will be used in the traffic analysis to determine the impacts, if any, of the additional traffic generated by the 130th Street station to the Altgeld Gardens street network near the station.

Intersection Summary	
Area Type:	Other

Cycle Length: 85

Actuated Cycle Length: 85

Offset: 0 (0%), Referenced to phase 4:EBTL and 8:WBTL, Start of Green

Natural Cycle: 75

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.82

Intersection Signal Delay: 17.3 Intersection LOS: B

Intersection Capacity Utilization 88.8% ICU Level of Service E

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary	
Area Type:	Other

Cycle Length: 85
Actuated Cycle Length: 85
Offset: 0 (0%), Referenced to phase 4:EBTL and 8:WBTL, Start of Green
Natural Cycle: 75
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.82

Intersection Signal Delay: 17.3	Intersection LOS: B
Intersection Capacity Utilization 95.2%	ICU Level of Service F

Analysis Period (min) 15
# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: Ellis Avenue & 130th Street

Intersection Summary	
Area Type:	Other

Cycle Length: 85
Actuated Cycle Length: 85
Offset: 0 (0%), Referenced to phase 4:EBTL and 8:WBTL, Start of Green
Natural Cycle: 70
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.73
Intersection Signal Delay: 21.9 Intersection LOS: C
Intersection Capacity Utilization 92.3% ICU Level of Service F
Analysis Period (min) 15
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Splits and Phases: 1: Ellis Avenue & 130th Street

Attachment D – Historic and Cultural Resources Supporting Information

Although this Supplemental EA only covers the three proposed changes described in Chapter 2, the *Section 106 Eligibility Report* and the *Section 106 Effects Report* included in this attachment cover the entire CTA RLE Preferred Alignment. Because Section 106 consultation with SHPO started before preparation of this Supplemental EA, these reports provide a concise summary of eligibility and effects determinations.

RE: Section 106 Consulting Party Invitation – CTA Red Line Extension (RLE) Project, Chicago, IL

Mr. Elzondo:

The Federal Transit Administration (FTA), in cooperation with the Chicago Transit Authority (CTA), is completing an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) Project in Chicago, Illinois. The RLE Project would extend the Red Line from the existing 95th Street Terminal to 130th Street. The proposed 5.6-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus and parking facilities. The RLE Project would also provide a modern, efficient railcar storage yard and shop facility. A project map of the preferred alignment is enclosed for reference (see Enclosure #2).

A Draft EIS for the RLE Project was published October 6, 2016 and the Project's Preferred Alignment was selected and announced on January 26, 2018. FTA and CTA previously conducted a Section 106 consultation process in coordination with the Illinois State Historic Preservation Office (SHPO) and other identified consulting parties as part of the Draft EIS. Documentation on the previous Section 106 consultation can be found in the Draft EIS available at https://www.transitchicago.com/redext/drafteis/.

As part of its responsibilities under 36 CFR § 800 – Protection of Historic Properties and the National Historic Preservation Act (NHPA), FTA and CTA are re-initiating the Section 106 consultation process as a result of changes to the project. The most notable change to be evaluated for effects on historical resources is the relocation of the 130th Street station from a location north of 130th Street to a location south of 130th Street, adjacent to Altgeld Gardens.

Section 106 of the NHPA requires federal agencies to take into account the effects of their undertakings on historic properties. This process involves efforts to identify historic properties potentially affected by the undertaking, assess its effects, and seek ways to avoid, minimize or mitigate any adverse effects on historic properties. In accordance with 36 CFR § 800.2(c), you are invited to participate in the Section 106 process as a Consulting Party. As part of the process, the project team will work through a three-step process with consulting parties to:

1. Identify historic properties that could be potentially affected by the project,
2. Assess project effects on these resources, and
3. If there are adverse effects, develop ways to avoid, minimize, or mitigate adverse effects on historic properties.

We are inviting you to participate in consultation to help us identify places that may have traditional religious and cultural importance to your tribal organization. Please note that we are requesting information only on such places that you believe may be impacted by the proposed project so that we may try to avoid impacts. We would be pleased to discuss project details as well any confidential concerns you may identify.

Your timely response to this invitation will greatly help us incorporate your concerns into project development. For that purpose, we respectfully request that you complete the enclosed Project Consultation Options Form (See Enclosure #1) and forward it to FTA within ***30 days of receipt*** of this letter.

If you have questions or comments related to the proposed project, please contact Tony Greep of the FTA Regional Office at the address above, by telephone at 312-353-1646 or by email at anthony.greep@dot.gov.

Sincerely,

Jay M. Ciavarella
Director, Office of Planning and Program Development

ecc: Tony Greep, FTA
Elizabeth Breiseth, FTA
Marlise Fratinardo, CTA

RE: Section 106 Consulting Party Invitation – CTA Red Line Extension (RLE) Project, Chicago, IL

Mr. Andrews:

The Federal Transit Administration (FTA), in cooperation with the Chicago Transit Authority (CTA), is completing an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) Project in Chicago, Illinois. The RLE Project would extend the Red Line from the existing 95th Street Terminal to 130th Street. The proposed 5.6-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus and parking facilities. The RLE Project would also provide a modern, efficient railcar storage yard and shop facility. A project map of the preferred alignment is enclosed for reference (see Enclosure #2).

A Draft EIS for the RLE Project was published October 6, 2016 and the Project's Preferred Alignment was selected and announced on January 26, 2018. FTA and CTA previously conducted a Section 106 consultation process in coordination with the Illinois State Historic Preservation Office (SHPO) and other identified consulting parties as part of the Draft EIS. Documentation on the previous Section 106 consultation can be found in the Draft EIS available at https://www.transitchicago.com/redext/drafteis/.

As part of its responsibilities under 36 CFR § 800 – Protection of Historic Properties and the National Historic Preservation Act (NHPA), FTA and CTA are re-initiating the Section 106 consultation process as a result of changes to the project. The most notable change to be evaluated for effects on historical resources is the relocation of the 130th Street station from a location north of 130th Street to a location south of 130th Street, adjacent to Altgeld Gardens.

Section 106 of the NHPA requires federal agencies to take into account the effects of their undertakings on historic properties. This process involves efforts to identify historic properties potentially affected by the undertaking, assess its effects, and seek ways to avoid, minimize or mitigate any adverse effects on historic properties. In accordance with 36 CFR § 800.2(c), you are invited to participate in the Section 106 process as a Consulting Party. As part of the process, the project team will work through a three-step process with consulting parties to:

1. Identify historic properties that could be potentially affected by the project,
2. Assess project effects on these resources, and
3. If there are adverse effects, develop ways to avoid, minimize, or mitigate adverse effects on historic properties.

We are inviting you to participate in consultation to help us identify places that may have traditional religious and cultural importance to your tribal organization. Please note that we are requesting information only on such places that you believe may be impacted by the proposed project so that we may try to avoid impacts. We would be pleased to discuss project details as well any confidential concerns you may identify.

Your timely response to this invitation will greatly help us incorporate your concerns into project development. For that purpose, we respectfully request that you complete the enclosed Project Consultation Options Form (See Enclosure #1) and forward it to FTA within ***30 days of receipt*** of this letter.

If you have questions or comments related to the proposed project, please contact Tony Greep of the FTA Regional Office at the address above, by telephone at 312-353-1646 or by email at anthony.greep@dot.gov.

Sincerely,

Jay M. Ciavarella

RE: Section 106 Consulting Party Invitation – CTA Red Line Extension (RLE) Project, Chicago, IL

Mr. Grignon:

The Federal Transit Administration (FTA), in cooperation with the Chicago Transit Authority (CTA), is completing an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) Project in Chicago, Illinois. The RLE Project would extend the Red Line from the existing 95th Street Terminal to 130th Street. The proposed 5.6-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus and parking facilities. The RLE Project would also provide a modern, efficient railcar storage yard and shop facility. A project map of the preferred alignment is enclosed for reference (see Enclosure #2).

A Draft EIS for the RLE Project was published October 6, 2016 and the Project's Preferred Alignment was selected and announced on January 26, 2018. FTA and CTA previously conducted a Section 106 consultation process in coordination with the Illinois State Historic Preservation Office (SHPO) and other identified consulting parties as part of the Draft EIS. Documentation on the previous Section 106 consultation can be found in the Draft EIS available at https://www.transitchicago.com/redext/drafteis/.

As part of its responsibilities under 36 CFR § 800 – Protection of Historic Properties and the National Historic Preservation Act (NHPA), FTA and CTA are re-initiating the Section 106 consultation process as a result of changes to the project. The most notable change to be evaluated for effects on historical resources is the relocation of the 130th Street station from a location north of 130th Street to a location south of 130th Street, adjacent to Altgeld Gardens.

Section 106 of the NHPA requires federal agencies to take into account the effects of their undertakings on historic properties. This process involves efforts to identify historic properties potentially affected by the undertaking, assess its effects, and seek ways to avoid, minimize or mitigate any adverse effects on historic properties. In accordance with 36 CFR § 800.2(c), you are invited to participate in the Section 106 process as a Consulting Party. As part of the process, the project team will work through a three-step process with consulting parties to:

1. Identify historic properties that could be potentially affected by the project,
2. Assess project effects on these resources, and
3. If there are adverse effects, develop ways to avoid, minimize, or mitigate adverse effects on historic properties.

We are inviting you to participate in consultation to help us identify places that may have traditional religious and cultural importance to your tribal organization. Please note that we are requesting information only on such places that you believe may be impacted by the proposed project so that we may try to avoid impacts. We would be pleased to discuss project details as well any confidential concerns you may identify.

Your timely response to this invitation will greatly help us incorporate your concerns into project development. For that purpose, we respectfully request that you complete the enclosed Project Consultation Options Form (See Enclosure #1) and forward it to FTA within ***30 days of receipt*** of this letter.

If you have questions or comments related to the proposed project, please contact Tony Greep of the FTA Regional Office at the address above, by telephone at 312-353-1646 or by email at anthony.greep@dot.gov.

Sincerely,

Jay M. Ciavarella

Re: Section 106 Consulting Party Invitation - Red Line Extension (RLE) Project

Dear Dr. Briggs:

The Federal Transit Administration (FTA), in cooperation with the Chicago Transit Authority (CTA), is completing an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) Project in Chicago, Illinois. The RLE Project would extend the Red Line from the existing 95th Street Terminal to 130th Street. The proposed 5.6-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus and parking facilities. The RLE Project would also provide a modern, efficient railcar storage yard and shop facility. A project map is attached for reference.

A Draft EIS for the RLE Project was published on October 6, 2016 and the Project's Preferred Alignment was selected and announced on January 26, 2018. FTA and CTA previously conducted a Section 106 consultation process in coordination with the Illinois State Historic Preservation Office (SHPO) and other identified consulting parties as part of the Draft EIS. Documentation on the previous Section 106 consultation can be found in the Draft EIS available at https://www.transitchicago.com/redext/drafteis/.

As part of its responsibilities under 36 CFR § 800 – Protection of Historic Properties and the National Historic Preservation Act (NHPA), FTA and CTA are re-initiating the Section 106 consultation process as a result of changes to the project. The most notable change to be evaluated for effects on historical resources is the relocation of the 130th Street station from a location north of 130th Street to a location south of 130th Street, adjacent to Altgeld Gardens.

Section 106 of the NHPA requires federal agencies to take into account the effects of their undertakings on historic properties. This process involves efforts to identify historic properties potentially affected by the undertaking, assess its effects, and seek ways to avoid, minimize or mitigate any adverse effects on historic properties. In accordance with 36 CFR § 800.2(c), you

are invited to participate in the Section 106 process as a consulting party. As part of the process, the project team will work through a three-step process with consulting parties to:

1. Identify historic properties that could be potentially affected by the project;
2. Assess project effects on these resources; and
3. If there are adverse effects, develop ways to avoid, minimize, or mitigate adverse effects on historic properties.

Participation in this process is voluntary and open to anyone "with a demonstrated interest in the effect of the undertaking on properties listed on or eligible for listing on the National Register of Historic Places." This may include property owners, business owners, historic preservation groups, neighborhood associations, or others who are interested in historic resources and preservation. Additional information about the consultation process is available online at https://www.achp.gov/digital-library-section-106-landing/citizens-guide-section-106-review. The project website is available at https://www.transitchicago.com/redext/.

Please respond by email within 30 days of receipt of this letter indicating whether or not you would like to participate as a Section 106 consulting party. Please direct your response to Marlise Fratinardo at mfratinardo@transitchicago.com. If you indicate that you do not desire to be a Section 106 consulting party or if you do not reply within this time period, you will not be included on the further Section 106 coordination efforts for this project.

Thank you for your cooperation and interest in this project. If you have questions, please contact me by email at mfratinardo@transitchicago.com.

Re: Section 106 Consulting Party Invitation - Red Line Extension (RLE) Project

Dear Ms. Morriss:

The Federal Transit Administration (FTA), in cooperation with the Chicago Transit Authority (CTA), is completing an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) Project in Chicago, Illinois. The RLE Project would extend the Red Line from the existing 95th Street Terminal to 130th Street. The proposed 5.6-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus and parking facilities. The RLE Project would also provide a modern, efficient railcar storage yard and shop facility. A project map is attached for reference.

A Draft EIS for the RLE Project was published on October 6, 2016 and the Project's Preferred Alignment was selected and announced on January 26, 2018. FTA and CTA previously conducted a Section 106 consultation process in coordination with the Illinois State Historic Preservation Office (SHPO) and other identified consulting parties as part of the Draft EIS. Documentation on the previous Section 106 consultation can be found in the Draft EIS available at https://www.transitchicago.com/redext/drafteis/.

As part of its responsibilities under 36 CFR § 800 – Protection of Historic Properties and the National Historic Preservation Act (NHPA), FTA and CTA are re-initiating the Section 106 consultation process as a result of changes to the project. The most notable change to be evaluated for effects on historical resources is the relocation of the 130th Street station from a location north of 130th Street to a location south of 130th Street, adjacent to Altgeld Gardens.

Section 106 of the NHPA requires federal agencies to take into account the effects of their undertakings on historic properties. This process involves efforts to identify historic properties potentially affected by the undertaking, assess its effects, and seek ways to avoid, minimize or mitigate any adverse effects on historic properties. In accordance with 36 CFR § 800.2(c), you

are invited to participate in the Section 106 process as a consulting party. As part of the process, the project team will work through a three-step process with consulting parties to:

1. Identify historic properties that could be potentially affected by the project;
2. Assess project effects on these resources; and
3. If there are adverse effects, develop ways to avoid, minimize, or mitigate adverse effects on historic properties.

Participation in this process is voluntary and open to anyone "with a demonstrated interest in the effect of the undertaking on properties listed on or eligible for listing on the National Register of Historic Places." This may include property owners, business owners, historic preservation groups, neighborhood associations, or others who are interested in historic resources and preservation. Additional information about the consultation process is available online at https://www.achp.gov/digital-library-section-106-landing/citizens-guide-section-106-review. The project website is available at https://www.transitchicago.com/redext/.

Please respond by email within 30 days of receipt of this letter indicating whether or not you would like to participate as a Section 106 consulting party. Please direct your response to Marlise Fratinardo at mfratinardo@transitchicago.com. If you indicate that you do not desire to be a Section 106 consulting party or if you do not reply within this time period, you will not be included on the further Section 106 coordination efforts for this project.

Thank you for your cooperation and interest in this project. If you have questions, please contact me by email at mfratinardo@transitchicago.com.

Sincerely,

Marlise Fratinardo

Re: Section 106 Consulting Party Invitation - Red Line Extension (RLE) Project

Dear Mr. Randall:

The Federal Transit Administration (FTA), in cooperation with the Chicago Transit Authority (CTA), is completing an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) Project in Chicago, Illinois. The RLE Project would extend the Red Line from the existing 95th Street Terminal to 130th Street. The proposed 5.6-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus and parking facilities. The RLE Project would also provide a modern, efficient railcar storage yard and shop facility. A project map is attached for reference.

A Draft EIS for the RLE Project was published on October 6, 2016 and the Project's Preferred Alignment was selected and announced on January 26, 2018. FTA and CTA previously conducted a Section 106 consultation process in coordination with the Illinois State Historic Preservation Office (SHPO) and other identified consulting parties as part of the Draft EIS. Documentation on the previous Section 106 consultation can be found in the Draft EIS available at https://www.transitchicago.com/redext/drafteis/.

As part of its responsibilities under 36 CFR § 800 – Protection of Historic Properties and the National Historic Preservation Act (NHPA), FTA and CTA are re-initiating the Section 106 consultation process as a result of changes to the project. The most notable change to be evaluated for effects on historical resources is the relocation of the 130th Street station from a location north of 130th Street to a location south of 130th Street, adjacent to Altgeld Gardens.

Section 106 of the NHPA requires federal agencies to take into account the effects of their undertakings on historic properties. This process involves efforts to identify historic properties potentially affected by the undertaking, assess its effects, and seek ways to avoid, minimize or mitigate any adverse effects on historic properties. In accordance with 36 CFR § 800.2(c), you

are invited to participate in the Section 106 process as a consulting party. As part of the process, the project team will work through a three-step process with consulting parties to:

1. Identify historic properties that could be potentially affected by the project;
2. Assess project effects on these resources; and
3. If there are adverse effects, develop ways to avoid, minimize, or mitigate adverse effects on historic properties.

Participation in this process is voluntary and open to anyone "with a demonstrated interest in the effect of the undertaking on properties listed on or eligible for listing on the National Register of Historic Places." This may include property owners, business owners, historic preservation groups, neighborhood associations, or others who are interested in historic resources and preservation. Additional information about the consultation process is available online at https://www.achp.gov/digital-library-section-106-landing/citizens-guide-section-106-review. The project website is available at https://www.transitchicago.com/redext/.

Please respond by email within 30 days of receipt of this letter indicating whether or not you would like to participate as a Section 106 consulting party. Please direct your response to Marlise Fratinardo at mfratinardo@transitchicago.com. Subject: Section 106 NPS Consulting Party
Attachments: FW: CTA Red Line Extension Section 106 Consultation: Pullman National Monument; Revised Consulting Party List_Rev04_mxf.xlsx

Hi Grace,

I have an update for you and your Section 106 team regarding the National Park Service/Pullman National Monument and their joining as a consulting party. They have formally requested to join as a consulting party (see attached email). The attached consulting party list has been updated to include NPS Pullman.

Can you get a link (with a one-month long expiration) in order to provide this new consulting part all the prior documentation sent to the other consulting parties? These items would be: 1) final eligibility report; 2) first consulting party meeting minutes; 3) comment responses; and 4) copy of first consulting party meeting presentation. It would be PDFs of all these documents. You should have all of these, but let me know if you need me to provide anything to you or if you have any questions.

Thank you,

Patrick

Section 1 - Executive Summary

Section 106 of the National Historic Preservation Act (NHPA) requires federal agencies to consider effects on historic properties from their actions. As stated in 36 CFR § 800, the Section 106 process "seeks to accommodate historic preservation concerns with the needs of Federal undertakings through consultation" (36 CFR § 800.1(a)). The process is designed to identify historic properties which may be affected by the undertaking, assess effects, and seek ways to avoid, minimize, or mitigate any adverse effects on historic properties. The Federal Transit Administration (FTA) is serving as the lead federal agency for the Red Line Extension (RLE) Project and is responsible for Section 106 compliance.

This document summarizes information previously provided on potential historic and cultural resources affected by the RLE Project and Section 106 consultation conducted to date. Such information can be found in the RLE Draft Environmental Impact Statement (EIS) and is summarized in the *Eligibility and Effects Summary Report* (CTA 2016) included in **Appendix B**. The Chicago Transit Authority (CTA) selected a Preferred Alignment after Section 106 consultation had been completed (in 2017). The purpose of this document is to continue consultation with the State Historic Preservation Office (SHPO) and other identified Consulting Parties based on refined project elements that result in changes to the Area of Potential Effect (APE) and additional identification of historic properties. All information provided in this document is consistent with previous correspondence and materials provided during the Draft EIS Section 106 consultation process.

1.1 Draft EIS

Section 106 is a consultative process consisting of four sequential steps. These steps are:

1. Initiation of the Section 106 Process - This includes establishing the undertaking and identification of Consulting Parties.
2. Identification of Historic Properties - This includes determination of an APE and the historic properties and archaeological resources within.
3. Assessment of Adverse Effects - This includes application of criteria of adverse effect to the historic properties within the APE.
4. Resolution of Adverse Effects - This includes development and evaluation of alternatives to avoid, minimize, or mitigate adverse effects on historic properties.

For the Draft EIS Section 106 assessment of historic properties and archaeological resources, FTA, CTA, the SHPO, and other Consulting Parties conducted the first three steps of this process following requirements of 36 CFR § 800:

1. Initiation of the Section 106 Process – The proposed project was determined to have potential to cause effects on historic properties. FTA and CTA identified the appropriate SHPO, Tribal Historic Preservation Offices (THPO), and other Consulting Parties and invited them to participate in the Section 106 process.
2. Identification of Historic Properties -
    a. Determination of the APE - In consultation with the SHPO and Consulting Parties, FTA and CTA determined an APE for the Project which included two options: Union Pacific Railroad (UPRR) Rail Alternative East and West Options. These options are described in **Appendix B**. The APE is defined as the geographic area within which the project may cause alterations in the character or use of historic properties. Development of the APE involved site visits and a review of aerial photography images and conceptual engineering drawings for the alternatives considered in the Draft EIS.
    b. Identify Historic Properties and Archaeological Resources – Due to the developed urban environment and linear nature of the project, it was determined that effects on properties would be similar for adjacent properties. Therefore, in coordination with the SHPO, it was determined that use of a representative sample was appropriate for the Project. The properties included in the representative sample were determined using GIS databases provided by the City of Chicago, the Historic and Architectural Resources Geographic Information System (HARGIS), online mapping resources, SHPO records, and field visits. Additional details about the definition of the representative sample, and resources in it, are included in **Appendix B**. After an extensive records check, representative samples within the APE footprint were field-surveyed to identify any archaeological resources and historic properties that meet National Register of Historic Places (NRHP) criteria. NRHP criteria are defined in 36 CFR § 60.4 and apply to districts, sites, buildings, structures, or objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association with one or more of the following four criteria:

        - Criterion A – Events that have made a significant contribution to the broad patterns of American history on a federal, state, and/or local level

        - Criterion B – Lives of persons significant in the history of the city, state, and/or the United States

        - Criterion C – Distinctive characteristics of a type, period, or method of construction, or the work of a master, or high artistic values, or a significant and distinguishable entity whose components may lack individual distinction

- Criterion D – Information important to prehistory or history

FTA and CTA identified properties listed in the NRHP, local landmarks, and Chicago Historic Resources Survey (CHRS) "Orange"-rated buildings (properties identified by the City to possess some architectural feature or historical association that made them potentially significant in the context of the surrounding community). FTA and CTA conducted background research to assist this process, using HARGIS and city records, fire insurance and other historical maps, the CHRS, previous architectural surveys in the area, and other relevant scholarly publications. No properties or districts previously listed in the NRHP were present in the APE. Seven historic properties within the APE were determined eligible for listing on NRHP.

3. Assessment of Adverse Effects – In consultation with the SHPO and Consulting Parties, FTA and CTA assessed effects for each property that was listed in the NRHP or determined eligible for listing. The effects assessment completed for the Draft EIS in 2016 included review of specific direct and indirect impacts (for topics such as displacements, noise, and visual impacts) resulting from specific project elements to determine if they might alter the characteristics that qualify properties for inclusion in the NRHP. Results of the effects assessment are summarized in **Table 1-1**. Because no adverse effect was found for the Project, step four of the Section 106 process was not required.

Table 1-1: NRHP-Eligible Properties in the APE - Union Pacific Railroad Alternative East and West Options

Address	Description	Union Pacific Railroad Alternative East Option Effects Finding	Union Pacific Railroad Alternative West Option Effects Finding
444 W. 100th Place	Eclectic Neo-Traditional Home	No Historic Properties Affected	No Historic Properties Affected
324 W. 104th Street	Fire Department Engine Company 93	No Historic Properties Affected	No Historic Properties Affected
351 W. 104th Street	Roseland Pumping Station	No Adverse Effect	No Historic Properties Affected

133-139 E. Kensington Avenue	Former Venetian Hall	No Historic Properties Affected	No Historic Properties Affected
Multiple	Altgeld Gardens Historic District	No Historic Properties Affected	No Historic Properties Affected

1.2 Preferred Alignment

The Preferred Alignment, selected in 2018 after publication of the Draft EIS, is a hybrid of the UPRR East and West Options. North of 108th Place, the Preferred Alignment follows the UPRR West Option and then south of 108th Place it follows the UPRR East Option to 119th Street. South of 119th Street the UPRR East and West Options were on the same alignment to the terminus of the RLE Project north of 130th Street. The Preferred Alignment would continue along this same alignment to 130th Street but terminate on the south side of 130th Street.

Changes to the RLE Project have required expansion of the APE in two locations. The expanded APE was reviewed and a selection of historic-age resources (45 years or older) within the expanded APE were surveyed utilizing the approach described in **Section 1.1**. Fifteen historic-age resources were surveyed and evaluated for NRHP eligibility. Of these, seven were recommended as eligible for listing in the NRHP. An additional fifty-nine properties within the expanded APE were identified as NRHP-eligible because they are contributing resources to Altgeld Gardens-Philip Murray Homes Historic District. Combined with the seven historic properties identified in the Draft EIS, a total of seventy-three historic properties are located within the Project APE. These numbers are summarized in **Table 1-2**.

Table 1-2: Historic Properties in the Project APE

2016 Draft EIS	2021 Expanded APE		Total Historic Properties in the Project APE
7 determined eligible	7 recommended eligible as result of 2020 survey	59 previously determined eligible as part of Altgeld Gardens-Philip Murray Homes Historic District	73

Source: JLK Architects

The following sections of this report provide further details on the APE expansion and eligibility determinations made for the Preferred Alignment and associated Project changes.

Section 2 - Project Introduction

2.1 Project Description

The RLE Project would extend the Red Line from the existing 95th/Dan Ryan terminal to 130th Street. The proposed 5.6-mile extension would be elevated from 95th to 119th Streets, at-grade south of 119th Street to 130th Street, and would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus connections and parking facilities. The RLE Project would reduce commute times for residents, improve mobility and accessibility, and provide connection to other transportation modes. The RLE Project could also foster economic development, where new stations may serve as catalysts for neighborhood revitalization and help reverse decades of disinvestment in local business districts. The RLE Project would also provide a modern, efficient car storage yard and shop facility near 120th Street.

CTA undertook an extensive Alternatives Analysis process from 2006 to 2009 that considered multiple modes and corridor options for the RLE Project. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative on August 12, 2009. Based on further technical analysis and public input, CTA selected the UPRR Rail Alternative as the NEPA Preferred Alternative in August 2014. Additional details on the alternatives development process and history, including the entirety of alternatives evaluated between 2012 and 2014 as part of the Draft EIS Section 106 consultation process for this portion of the project are provided in the 2016 *Eligibility and Effects Summary Report* (CTA 2016) in **Appendix B.**

The UPRR Alternative as presented in the Draft EIS included two options, the East Option and the West Option. On January 26, 2018, the Preferred Alignment for the RLE Project was announced by CTA to the public. The Preferred Alignment is a combination of the UPRR East Option and West Option and would capture the benefits and minimize the impacts disclosed in the Draft EIS of selecting either option.

The Preferred Alignment would run south along I-94 from the 95th/Dan Ryan terminal, then curve west along the north side of I-57 between 97th and 98th Streets (within the I-57 right-of-way) until it reaches the UPRR corridor adjacent to Eggleston Avenue. The alignment would then run south to follow the UPRR corridor for approximately 1 mile. The extension would follow the UPRR corridor, on the west of the existing UPRR corridor, to 108th Street, where it begins traveling east and crossing over the existing UPRR corridor and going south along the east side of the UPRR Corridor to the 111th Street station.

The proposed rail extension would then continue running in a southeasterly direction along the east side of the UPRR corridor to 119th Street where it leaves the UPRR corridor and crosses over the Canadian National and Metra rail corridor between Kensington Park on the southwest and South Front Avenue on the northeast. The extension then continues southeast crossing over a Norfolk Southern Railroad (NS) industrial lead track. The extension then continues southeast along the NS corridor running along the west side of the NS tracks. A new shop and yard would be located at 120th Street. The extension would run along the west side of the NS tracks and adjacent to South Cottage Grove Avenue on the west until crossing under 130th Street where it terminates on the east side of Altgeld Gardens, west of Carver Military Academy High School. **Figure 2-1** shows the Preferred Alignment.

Figure 2-2-1: Preferred Alignment

2.1.1 Elevated Structure

The proposed elevated structure would be a closed-deck, steel and concrete, aerial track structure with direct-fixation track and welded rail (welded at joints). With direct-fixation track, rails are mounted to specially-designed concrete blocks fixed to the concrete deck. Noise barriers (approximately 4 feet in height, measured from the top surface of the concrete deck) are proposed for portions of the structure on both sides of the track deck to reduce noise transmission at and below track level. The structure would vary in height from 14 feet 9 inches to 40 feet above existing grade, depending on required clearances above existing roadways and railroads. The two tracks would have a spacing of 13 feet (13 feet between the track centerlines). The elevated deck, on which the tracks would run, would vary in width from approximately 30 feet to approximately 52 feet at stations

Figure 2-2 is a photo simulation of a typical proposed elevated structure above the UPRR right-of-way. The design shown is conceptual, and the actual design would vary based on further engineering and community input.

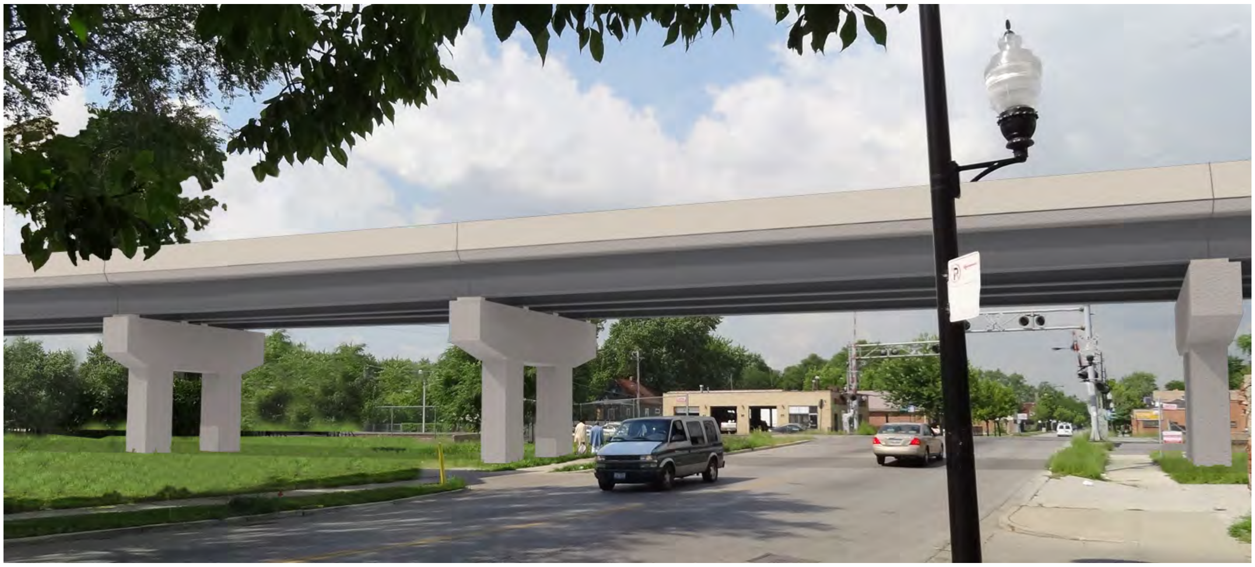

Figure 2-2: Photo Simulation of Typical Proposed Elevated Structure

2.1.2 Stations

New stations would be constructed at the following locations along the proposed alignment:

- 103rd Street (elevated station)

  The station platform would span over the street, with the main station entrance located on the north side of 103rd Street with an elevator, stair, and escalator to access the platform. An auxiliary station entrance would be located on the south side of 103rd Street with an elevator and stair to access the platform. The auxiliary station would have entrances on the front for bus transfers and pedestrians, and an entrance at the rear for park & ride transfers from the surface parking lot located south of the station. Street side bus stops in both directions on 103rd Street will provide direct transfers to the main and auxiliary station entrances.

- 111th Street (elevated station)

  The station platform would span from 111th Street to 110th Street, with the main station entrance located on the north side of 111th Street with an elevator, stair, and escalator to access the platform. An auxiliary exit would be located on the south side of 110th Street. Street side bus stops in both directions on 111th Street would provide direct transfers to the main station, and a surface parking lot would be located south of 111th Street. New crosswalks would be developed at 111th Street for pedestrian traffic, park & ride transfers, and eastbound bus transfers to the main station entrance.

- Michigan Avenue (elevated station)

  The station platform would span over Michigan Avenue, with station entrances on each side of Michigan Avenue. Two locations for the station parking garage are being considered. The locations are to the north and to the south of the UPRR. The station facility is anticipated to include a bus turnaround and a four-level parking garage. The station would have a main and an auxiliary station entrance. Both entrances would have elevators and stairs, with the main entrance also having an escalator. The station facility would also include a dedicated surface-level kiss & ride drop off. Existing thru traffic buses on Michigan Avenue would remain on the street with direct transfers to both station entrances. The tallest structure at Michigan Avenue station will likely be the station canopy of the platform on the elevated track structure.

- 130th Street (at-grade station)

  The station platform would be at-grade located south of 130th Street, running parallel to the adjacent Indiana Harbor Belt (IHB) Railroad tracks. The main station entrance would be located at the terminus of the extension on the north side of 132nd Street. A five-bay bus turnaround will be located to the west of the main station for direct transfers. A three-level parking garage would be located northwest of the station platform, with an auxiliary station entrance at the top level to bridge over the tracks to access the station platform for park & ride transfers. CTA Transportation Offices would also be located at the terminus, with a connection to the parking garage and auxiliary station entrance.

  Primary access to the 130th Street station would be provided from 130th Street to Ellis Avenue to Greenwood Avenue to 130th Place into the station area. Some exiting traffic could also travel from the station area to Old 130th Street to Ellis Avenue to 130th Street. Anticipated improvements along 130th Street would include minor lengthening of the west to southbound left turn lane and the east to southbound right turn lane. Station-related traffic within Altgeld Gardens would be limited to the roadways listed above.

Carver Military Academy High School is located east of the 130th Street Station and the IHB Railroad at the intersection of 132nd Street and Doty Avenue. Access to the high school would remain unchanged. Primary access to the school would be provided from 130th Street to Ellis Avenue to Greenwood Avenue to 132nd Street. From the south, the access is also possible along Doty Avenue to 132nd Street to the school entrance.

Each station would have a center platform, approximately 26 feet wide and 520 feet long. Platforms would accommodate ten-car trains. Each station would be Americans with Disabilities Act (ADA) accessible with elevators. **Figure 2-3** is a photo simulation of a typical proposed elevated station. The design shown is conceptual, and the actual design would vary based on further engineering and community input. Currently, there is no photo simulation available for a ground level station.

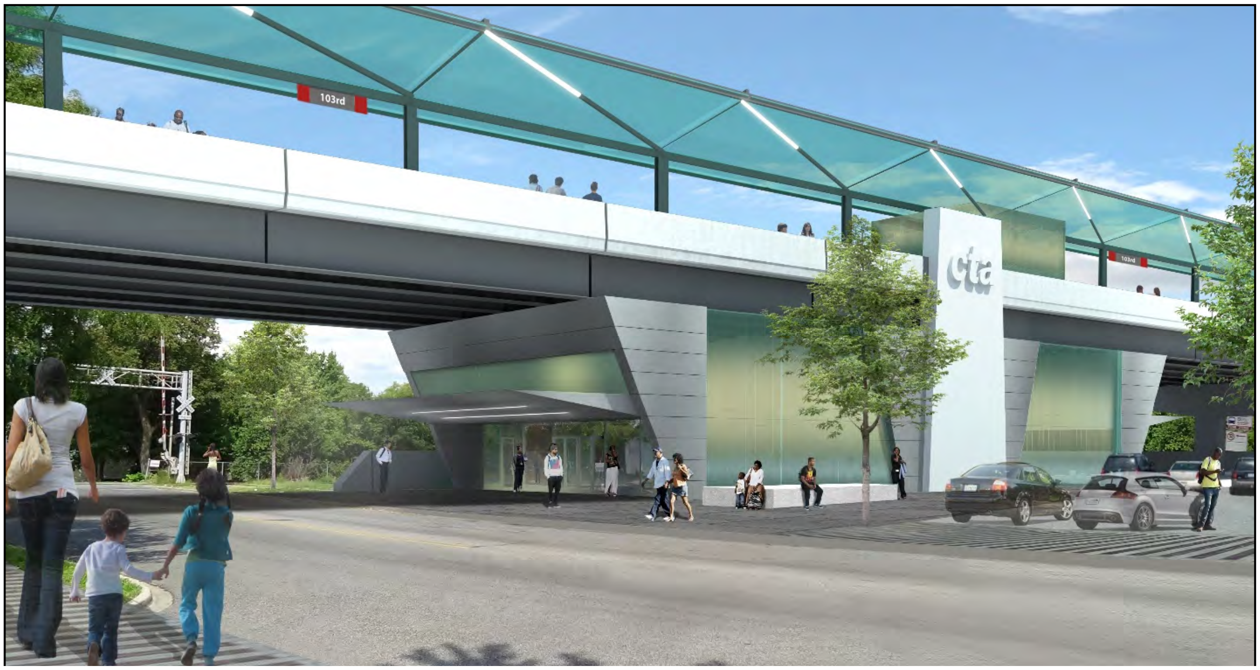

Figure 2-3: Photo Simulation of Typical Proposed Elevated Station

2.1.3 Park & Ride Facilities

To accommodate passengers arriving at the stations by car, park & ride facilities would be constructed near each station, as described in **Table 2-1**. A total of 2,400 parking spaces would be available along the corridor. CTA estimated parking demand based on travel demand modeling performed in 2020. Bus turnarounds would be provided in the parking areas at Michigan Avenue and 130th Street stations.

Table 2-1: Summary of Park & Ride Facilities

Station	Number of Parking Spaces	Conceptual Description
103rd Street	175	One surface parking lot on the west side of the tracks
111th Street	225	One surface parking lot
Michigan Avenue	800	Four-story parking structure
130th Street	1,200	Three-story parking structure

Source: CTA

2.1.4 120th Street Yard and Shop

The 120th Street yard and shop, with a capacity of 340 train cars, would be sited on a combination of industrial and vacant land east of the Canadian National/Metra Electric tracks and west of the NICTD/CSS & SBRR (Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad) tracks near 120th Street and Cottage Grove Avenue. The yard would be entirely at-grade. Parking spaces for CTA employees would be included at the yard.

2.1.5 Substations

Substations are buildings along the alignment that house equipment to regulate the flow of electricity to the third rail, which supplies power to the trains. Substations would be placed approximately 0.8 to 1 mile apart along the alignment. Six new or replacement substation locations are proposed: near 96th Street, near 104th Street, near 109th Place, near Indiana Avenue, within the 120th Street yard and shop area, and north of 130th Street.

2.1.6 Operating Plan

The Red Line, including the extension, will operate 24 hours a day, each day of the year. Anticipated service headways (time between arrivals) are shown in **Table 2-2**.

Table 2-2: Service Headways

Period	Northbound	Southbound
Morning Peak	5 minutes	3 to 4 minutes
Midday	7.5 minutes	7.5 minutes
Evening Peak	3 to 5 minutes	5 minutes
Late Evening (7 PM-Midnight)	7.5 minutes	7.5 minutes
Owl (Midnight-4 AM)	15 minutes	15 minutes

Source: CTA

Service headways would be adjusted to accommodate demand once the RLE service has been implemented. Train headways would vary throughout the day (like existing Red Line service).

Train sets would initially be eight cars long, however stations and track alignment would accommodate ten-car trains to provide the option of running ten-car trains in the future. With the extension of the Red Line, some existing bus routes would be rerouted to connect to the proposed stations.

2.2 Preferred Alignment Areas of Refinement

The Preferred Alignment includes four distinct project changes and refinements not included in the Draft EIS. These project changes include:

- Preferred Alignment 108th Place Cross-over

  With the selection of the Preferred Alignment, there is a change in the crossing of the UPRR at 108th Place, which was not included in the UPRR East Option or West Option. In the Draft EIS, the West Option had a crossing of the UPRR at Prairie Avenue near 117th Street, further south and at a higher elevation than the crossing at 108th Place.

- Michigan Avenue Station Refinement

  Proposed parking structure and bus turnaround concepts are being considered at two locations, on the north and the south sides of the UPRR. This change is dependent on confirmation of availability of parcels and future coordination with the City of Chicago.

- 120th Street Yard and Shop Refinement

  The 120th Street yard and shop and the tracks south to 130th Street were shifted approximately 100 feet to the west to accommodate the NS Railroad access to All American Recycling and the national freight rail network.

- 130th Street Station Relocation

  In the Draft EIS, the 130th Street station would be located north of 130th Street, adjacent to the Metropolitan Water Reclamation District of Greater Chicago (MWRD) Calumet Reclamation Plant. This location was the only viable option for the RLE Project’s terminus station at the time of the Draft EIS. An opportunity to relocate the station south of 130th Street arose after the 2017 demolition of the easternmost blocks of Altgeld Gardens, Blocks 11, 12, and 13.

2.3 Area of Potential Effect

The APE is defined as “the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist” (36 CFR 800.16.d). The APE developed for the Draft EIS of the RLE Project was delineated after considering the location of the proposed alternative options; the potential for ground disturbance, demolition, or property taking; locations from which the undertaking may be visible and/or audible; and the scale and setting of the project. This APE was developed in consultation with CTA, FTA, and SHPO.

Secretary of the Interior (SOI) qualified architectural historians developed the APE boundaries after conducting site visits and reviewing the aerial maps and engineering details (such as alignment locations, elevation of the proposed rail line, expected right-of-way limits, and the locations of the yard, stations, and parking facilities) for the build alternative.

Generally, the APE developed for the Draft EIS contains parcels within one block of the centerline of the UPRR Alternative. Because the project area is located within a heavily urbanized area, the boundaries for the APE were based on the area directly impacted by construction, the height of the new construction, and visual obstructions such as buildings and trees which may block views of the proposed construction, and the linear nature of the RLE Project. The APE widens to accommodate the locations of each park & ride and the proposed yard and shop beyond the one-block boundary. This APE included both the UPRR East Option and West Option.

Because the Draft EIS APE was developed to account for effects for both the East and West UPRR Options, it continues to do so for the Preferred Alignment, except at three of the four areas of project changes and refinements described in **Section 2.2**. For these reasons, the APE boundary from the Draft EIS is still considered appropriate for the project except in the areas of refinement as described below. See **Figure 2-4**.

At one area of project changes and refinements, no changes to the APE were required:

- Preferred Alignment 108th Place Cross-over

  The cross-over at 108th Place is contained within the project area presented in the Draft EIS and does not require extension of the APE at this location.

At one area of project changes and refinements, the APE has been shifted:

- 120th Street Yard and Shop Refinement

  The 120th Street Yard and Shop location has been shifted and the layout refined since the Draft EIS. The APE has been shifted approximately 100 feet to the west consistent with the shift in location of the 120th Street yard and shop. No historic properties, historic-age resources, or archeological materials were identified within this area.

At two areas of project changes and refinements, the APE has been expanded:

- Michigan Avenue Station Refinement

  Two locations for the station parking garage are being considered. The locations are to the north and to the south of the UPRR. The Draft EIS Section 106 APE had only included the south option and now the APE is expanding to include the north option. The selection of the station parking garage location is dependent on confirmation of availability of parcels and future coordination with the City of Chicago. The APE has been expanded one block to the north and east to include the north option. The APE has also been expanded to one full block in the south and west to adequately address potential effects in these areas. See **Figure 4-1**.

- 130th Street Station Relocation

  Following relocation of the 130th Street station south of 130th Street, the APE has been expanded to include the full site under consideration for construction and an approximate buffer of a quarter mile, except at visual obstructions where it is slightly truncated. This area is based on building density, height of the proposed work, visual observations on site, intended to encompass changes in traffic, noise, and vibration, caused by the Project. See **Figure 2-5**.

Section 3 - Methods for Identification of Resources

3.1 Identification of Historic Properties

3.1.1 Background Research/Historic Context

Background research was conducted to identify previously documented historic properties within the expanded APE areas. An extensive historic context had been developed for the Draft EIS and was determined sufficient to evaluate resources within the expanded APE. . The historic context includes relevant themes in the historical development of the area and provides a framework for evaluating the significance of historic-age resources. The following sources were consulted for identification and description of existing historic properties and those historic-age resources not yet recorded:

- The **HARGIS database** was created by the Illinois SHPO in 2003 to manage information about Illinois historic properties; this database documents the state's built environment. The HARGIS database includes data gathered as a result of three statewide survey projects: the Illinois Historic Structures Survey, the Illinois Historic Landmarks Survey, and the Illinois Rural Survey (conducted 1970–1987). The HARGIS database also includes properties identified as part of a NRHP nomination, surveys by local preservation groups, and information from the Illinois Department of Transportation's Bridge Survey. The database includes data forms, photographs, background documentation, and spatial information within a geographical context for each historic property and historic district within the dataset. This resource was consulted to identify historic properties within the APE.

- The **Chicago Historic Resources Survey (CHRS)** is an inventory of buildings that was compiled during 1983–1995. The Chicago Department of Housing and Economic Development published its findings in a report titled *Chicago Historic Resources Survey: An Inventory of Architecturally and Historically Significant Structures* in 1996. Organized according to Chicago's 77 neighborhoods, the inventory lists over 17,000 architecturally and historically significant buildings and structures that predate 1940. The information is also available online and is searchable by neighborhood, building address, decade of construction, architect's name, building style and type, survey ranking, and landmark status. This resource was consulted to confirm the status of historic-age buildings within the APE that had not yet been evaluated for the NRHP.

- The **Chicago Zoning and Land Use Map** is a database that includes information on existing buildings, structures, and parcels including Sanborn Fire Insurance maps, CHRS data, NRHP data, and local landmark designations. This resource was used to find addresses and confirm historic status of all buildings within the APE.

- **National Register Bulletin #15**, How to Apply the National Register Criteria for Evaluation, was consulted for the resources requiring NRHP evaluations.

3.1.2 Survey of Historic Resources

Initially, SOI qualified architectural historians conducted a field survey to confirm conditions presented in the Draft EIS. After the development of the expanded APE and review of historic contexts, cultural resource specialists conducted additional field surveys. Within the expanded APE areas, no additional properties were found that would be displaced or demolished as a result of the Preferred Alignment. Following methods of the Draft EIS, a representative sample of historic-age properties within the expanded APE areas were chosen for survey and documentation. As in the Draft EIS, the representative sample was chosen by researching the expanded APE areas for properties listed in HARGIS and the CHRS. Then each block was examined to understand the historic character of each including considerations of age, type of building, functions, architectural styles, and overall context. Sample properties were then chosen for their ability to represent these characteristics of each block.

All newly surveyed historic resources were documented with photographs of their exteriors from the public right-of-way. Additional archival research was conducted for each in order to evaluate potential historic significance and level of integrity.

In total, 15 historic-age properties were surveyed and one National Register eligible historic district was re-evaluated for the expanded project APE.

Survey forms for the 15 historic-age properties are included in **Appendix A**.

3.2 Identification of Archaeological Resources

From June 15 to June 16, 2020 Midwest Archaeological Research Services (MARS), conducted a Phase I Archaeological Reconnaissance Survey on the Preferred Alignment (**Figure 2-1**). Due to the majority of the survey area consisting of substantially disturbed inner-city terrain, the primary method of investigation was photographic recordation followed up with shovel test probes (STP) in surveyable areas. Shovel tests were excavated as specified by the Illinois SHPO. STPs are small subsurface sampling units approximately 14 inches in diameter and 14 to 20 inches deep that are excavated at 50-foot intervals across the project area. Soils from the probes were screened through ¼ inch hardware cloth. With the exception of one area, the entire project area contained non-excavatable soils (gravels or wetland areas). The one area that contained excavatable soils (likely disturbed during railroad and roadway construction) for shovel tests was located along Eggleston Avenue. Photographs were taken with the 16 MP Samsung S10e smartphone camera along the project area at prearranged locations. A total of 166 photographs were taken with 90 images selected as the best representation of the landscape.

In addition to field investigation, research was conducted to identify the prehistoric context for the area and to identify prehistoric Native American sites recorded within one mile of the RLE Project. This consisted of a new records check using the Illinois State Site Files database and included the entire Project area, including areas of the expanded APE.

See the full *Archeological Resources* report in **Appendix C**.

Section 4 - Survey and NRHP Evaluation Results

4.1 NRHP Eligibility Evaluation Guidelines

As part of the Section 106 review process, cultural resources investigations are undertaken with the purpose of identifying historic properties that are listed in, or eligible for listing in, the NRHP. The assessment of significance of cultural resources is based on federal guidelines and regulations. Any cultural resource that is listed in or eligible for inclusion in the NRHP is known as a “historic property,” and the term “eligible for inclusion in the NRHP” includes both properties formally determined as such by the Secretary of the Interior and all other properties that meet NRHP listing criteria (36 CFR 800.16). The criteria for evaluating properties for inclusion in the NRHP (36 CFR 60.4 [a–d]) are codified under the authority of the National Historic Preservation Act of 1966, as amended, and the Secretary of the Interior has set forth guidelines to use in determining eligibility. Subsequent to the identification of relevant historical themes and related research questions, these four criteria for eligibility are applied.

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in buildings, structures, objects, sites, and districts that possess integrity of location, design, setting, materials, workmanship, feeling, and association and one or more of the following:

A. that are *associated with events* that have made a significant contribution to the broad patterns of our history; or
B. that are *associated with the lives of persons* significant in our past; or
C. that *embody the distinctive characteristics* of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
D. that have *yielded, or may be likely to yield, information important in prehistory or history*. Note that the application of Criterion D presupposes that the information imparted by the site is significant in history or prehistory [36 CFR 60.4, emphasis added].

The physical characteristics and historic significance of the overall property are examined when conducting NRHP evaluations. Character-defining elements of a building are the physical features which help define its physical identity including overall form, materials, craftsmanship, decorative details, interior spaces and features, and setting.

For a building, structure, object, site, and district to be determined eligible for the NRHP, it must retain enough of its historic integrity to convey its significance. For the NRHP, there are seven aspects of integrity:

1. Location
2. Design
3. Setting
4. Materials
5. Workmanship
6. Feeling
7. Association.

4.2 Historic Properties Identified in the Draft EIS

Seven historic properties were identified as part of the Draft EIS. These properties are listed in **Table 4-1** below. See **Figure 2-4** for a map of these historic properties and the 2016 *Eligibility and Effects Summary Report* in **Appendix B** for additional information on Historic Properties identified in the Draft EIS.

Table 4-1: Historic Properties Identified in the Draft EIS

Address	Year Built	Description	NRHP Eligibility Criteria
444 W. 100th Place	1930	Eclectic Neo-Traditional Home	Criterion C

11321 S. Wentworth Ave	1930s	Roseland Community Hospital Nurses Home	Criterion A
133-139 E. Kensington Ave	1925	Former Venetian Hall	Criterion A
Multiple (Public Housing Project)	1945	Altgeld Gardens Historic District	Criterion A

4.3 Previously Identified Historic Properties and Historic-age Resources in the Expanded APE

Within the expanded APE, 65 historic properties and historic-age resources had previously been evaluated and found eligible for NRHP and or evaluated as a City of Chicago historic resource. This includes CHRS Orange-rated properties, the Altgeld Gardens-Philip Murray Homes Historic District, and buildings contributing to this historic district.

Table 4-2 summarizes previously identified historic properties and historic-age resources within the expanded APE.

Table 4-2: Previously Identified Historic Properties and Historic-Age Resources in the Expanded APE

Address	Year Built	Description	Area of Refinement	Status
11431-3 S. Michigan Avenue	1911	Commercial	Michigan Avenue Station	CHRS Orange

Source: JLK Architects

The Draft EIS included evaluation of the Altgeld Gardens Historic District based on an eligibility determination prepared in the 1990s which did not include the Philip Murray Homes. Currently, through guidance of the SHPO, the Chicago Housing Authority (CHA) is preparing a National Register Historic District nomination that includes both Altgeld Gardens and Philip Murray Homes. The Altgeld Gardens-Philip Murray Homes Historic District has been determined eligible under Criteria A, B, and C. See **Appendix D** *Altgeld Gardens-Philip Murray Homes Correspondence* for additional information. At this time, a final boundary and period of significance for this National Register Historic District have not been finalized, as the nomination is an ongoing process being undertaken by CHA in coordination with SHPO and the National Park Service.

4.4 Resources Surveyed in the Expanded APE

Fifteen historic-age resources within the expanded APE for the Preferred Alignment were surveyed and evaluated for NRHP eligibility. Survey forms were used to collect current and historical data on these properties and are included in **Appendix A** and listed in **Table 4-3**. Fourteen properties are within the expanded APE at Michigan Avenue Station, as shown in **Figure 4-1**. One property, Carver Military Academy, is within the expanded APE at 130th Street Station.

Table 4-3: Historic Resources Surveyed in the Expanded APE

4.5 Historic Properties Eligible for National Register of Historic Places

Of the fifteen buildings surveyed within the Roseland, West Pullman, and Riverdale community areas, seven were identified as eligible for listing on the NRHP. These are described briefly below. See **Appendix A** for additional information on these historic properties.

Table 4-4: NRHP-Eligible Historic Properties in the Expanded APE

Address	Year Built	Description	NRHP Eligibility Criteria
11431-11433 S. Michigan Avenue	1911	Commercial	Criterion A
11445-11447 S. Michigan Avenue	1903	Mixed-Use Commercial/Residential	Criteria A and C
11451 S. Michigan Avenue	1928	Commercial	Criteria A and C

13100 S. Doty Avenue	1973	Carver Military Academy	Criterion C

Source: JLK Architects

Commercial Building, 11431-11433 S. Michigan Avenue

This two-story commercial store front building is clad in red brick with terra cotta decorative elements. It was built in 1911 as a commercial property along South Michigan Avenue, the major commercial corridor for the Roseland community. The building was commissioned by Alfonse Vincent who worked in the wagon trade and whose descendants would open the first automobile sales agency in Roseland. The architect, Joseph T. Fortin, designed a large number of residential and commercial buildings in Chicago and surrounding suburbs.

The building consists of two stories plus basement constructed of red brick with decorative terra cotta elements on the west and north elevations. The primary east facade contains the majority of ornamentation but has been significantly altered. The intricately patterned, curvilinear and intertwined patterns of the terra cotta are similar to those seen in the designs of Louis Sullivan. However, much has been removed from the original design. The first floor storefront has been infilled with a modern brick and storefront system. The upper floor windows have been covered (or replaced) with siding. The north elevation remains largely unaltered.

This building is a good example of the commercial buildings built in Roseland's commercial district which was concentrated along South Michigan Avenue between 110th and 115th Streets during the first half of the 20th century. Due to this association, it is recommended eligible for the NRHP under Criterion A for commerce. Due to significant alterations to the storefront and removal/reconfiguration of original decorative material, it is not recommended eligible for NRHP under Criterion C for architecture.

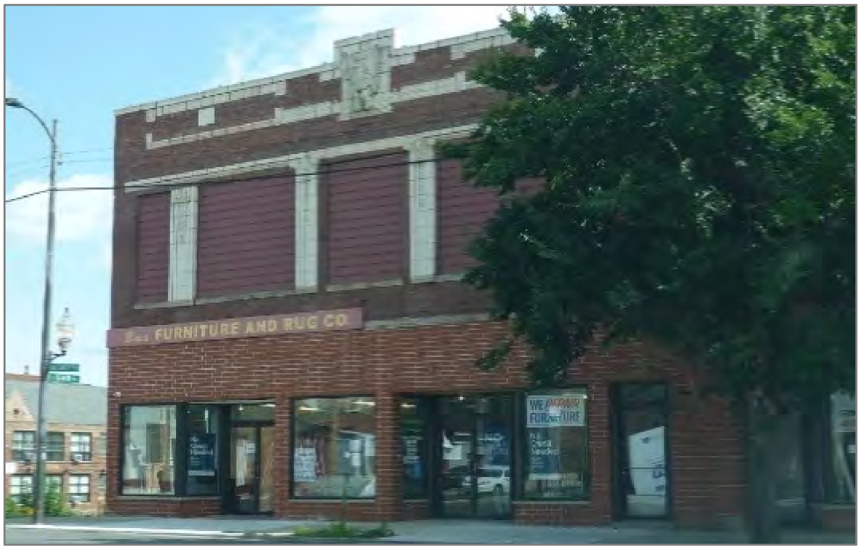

Figure 4-2: West Facade, 11431-11433 S. Michigan Avenue

Mixed-Use Commercial/Residential, 11445-11447 S. Michigan Avenue

This two-story mixed-use commercial/residential building in the Roseland commercial district was constructed in 1903 and designed by architects Burtar & Gassmann. It is located along South Michigan Avenue, the major commercial corridor for the Roseland community. The building is a classical three-bay wide building, visually divided by a center section flanked by two side sections with projecting bays. The building has storefronts on the first floor and residences above. The walls on the primary (west) elevation are Indiana limestone, mostly rusticated, but smooth above the second-story windows. The storefront on the north side of the front elevation is metal-framed glass with recessed entry, possibly original to the building. The south entrance and storefront have been boarded over. A limestone belt course runs below and above the second story windows. Ornamentation of the building includes a thick belt course projecting above the second story windows with brackets covered with cyma reversa with acanthus leaf molding that runs across the entire front facade, and a large triangular pediment above the second floor on the center section, decorated with a limestone laurel wreath, foliate and ribbons.

The CHRS identified this building "Orange" due to possession of architectural feature(s) or historical association that has made it potentially significant in the context of the surrounding community.

This building is a good example of the commercial buildings built in Roseland's commercial district, which was concentrated along South Michigan Avenue between 110th and 115th Streets during the first half of the 20th century. It is also an excellent example of the mixed-use configuration popular in this commercial district with commercial use on the first floor and residential above. Due to this association, it is recommended eligible for the NRHP under Criterion A for commerce. Although windows have been replaced at the west facade and the condition of the storefront at the south half of the building is unknown, the north storefront appears to be original and the stone portions of the facade are in good condition. Original decorative metal trim at the cornice is also intact and in fair condition. Because the resource retains sufficient architectural integrity and remains a good example of Classical Revival applied to a mixed-use building, it is recommended eligible for NRHP listing under Criterion C for architecture.

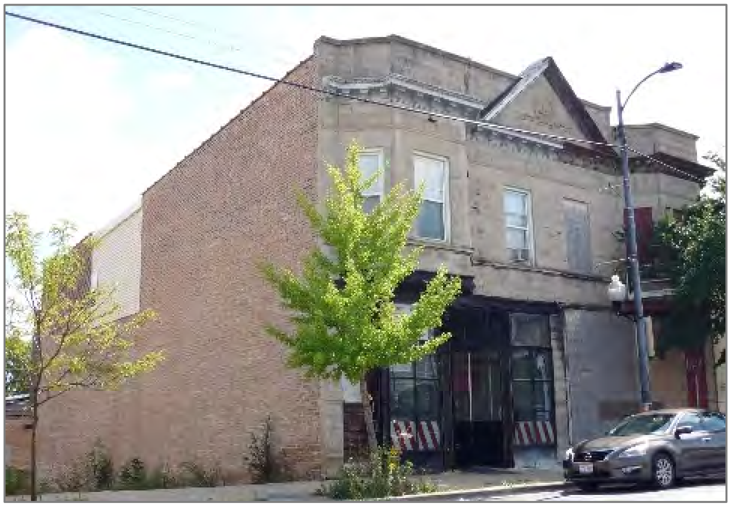

Figure 4-3: North and West Facades, 11445-11447 S. Michigan Avenue

Commercial Building, 11451 S Michigan Avenue

This one-story commercial building is located along South Michigan Avenue, the major commercial corridor for the Roseland community. It was constructed in 1928 and designed by local architect/engineer firm Loewenberg & Loewenberg who designed residential and storefront buildings in the city. The building was originally occupied by Sadock & Adelman, a furniture store and has since served several other commercial businesses including several furniture stores and a school of hair design.

The corner building was designed to address both street fronts, including a corner entrance and one centered on the west (S. Michigan Avenue) facade. The walls of the building are covered with rectangular terra cotta panels and further adorned by gold colored terra cotta stringcourse above the storefronts, cornice at both west and south elevations, and medallions at clerestory level. The storefront has been largely altered and boarded over. Additional windows at the south facade are octagonal in shape but have also been boarded over.

The CHRS has identified this building “Orange” due to possession of some architectural feature or historical association that has made it potentially significant in the context of the surrounding community.

This building is an excellent example of the commercial buildings built in Roseland’s commercial district which was concentrated along South Michigan Avenue between 110th and 115th Streets during the first half of the 20th century. Due to this association, it is recommended eligible for the NRHP under Criterion A for commerce. This building is also unique as a remaining Art Deco design within the Roseland Commercial district. Although the storefront has been altered and windows boarded over, terra cotta cladding and decorative medallions, octagonal window openings, decorative trim crowning the storefront, and the highly ornate building cornice remain in fair to excellent condition. Because the building retains sufficient architectural integrity and remains an excellent and unique example of Art Deco design, it is recommended eligible for NRHP listing under Criterion C for architecture.

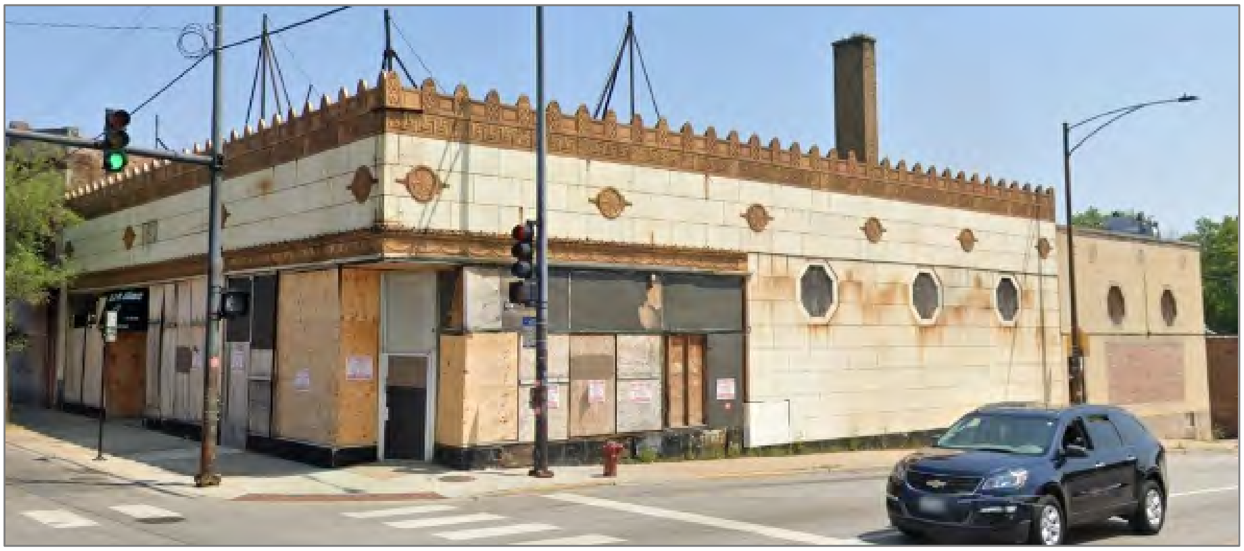

Figure 4-4: West and South Facades, 11451 S. Michigan Avenue

Single-Family Residence, 11452 S. Indiana Avenue

This two-story Italianate style house in the Roseland community was built circa 1880. It is a rare example of a brick-constructed two-story residence from this era. The 1880s was a time of transformation for the Roseland community with the establishment of the Pullman Palace Car Company to the east and development of several additional railroads in the area. This attracted an influx of workers, often immigrants from Sweden, Germany, England, and Ireland. Much of Roseland residences at this time were modest one-and-a-half story frame workers cottages.

This Italianate style building includes a gable-front with decorative fascia and paired eave brackets. The front porch roof appears to be a replacement. A bay-window projects from the south elevation near the rear of the house.

The CHRS has identified this building “Orange” due to possession an architectural feature(s) or historical association that has made it potentially significant in the context of the surrounding community. While window units, front door, and porch roof have been replaced, the original Italianate form of the building (including gable front and side bay window), deep decorative cornice with brackets, arched window openings, and brick facade remain in good condition. Because the building retains sufficient architectural integrity and is a unique remaining example of Italianate design, is recommended eligible for NRHP listing under Criterion C for architecture.

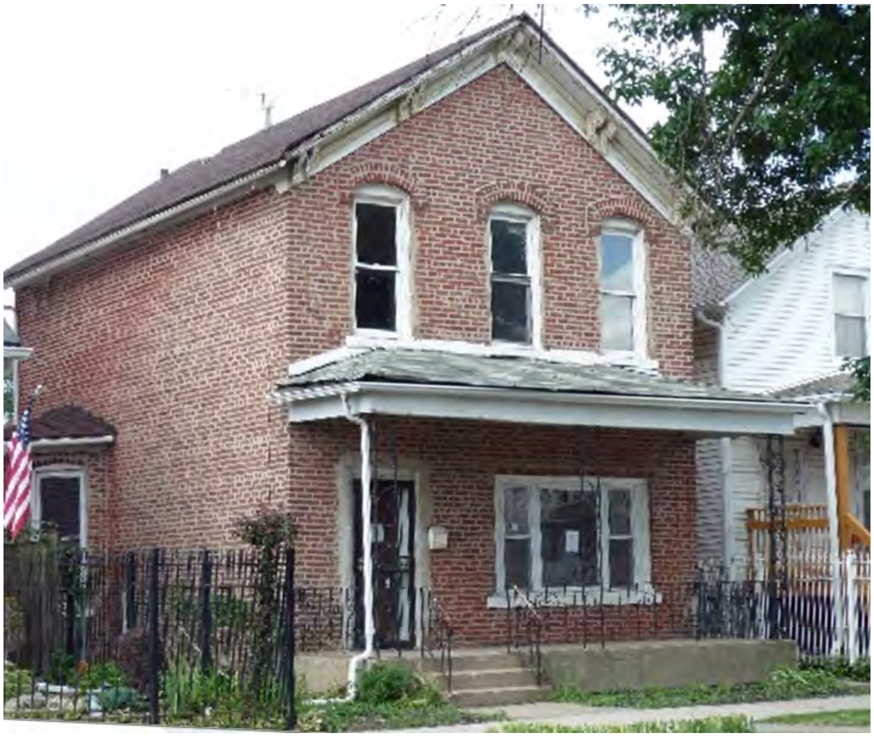

Figure 4-5: South and East Facades, 11452 S. Indiana Avenue

Scanlan Elementary, 11725 S. Perry Avenue

This Classical Revival style school in the West Pullman community was built in 1897. It is an excellent example of a Chicago Public School design by W. August Fiedler. An incredibly prolific designer, Fiedler designed 58 new school buildings as Chicago Board of Education Architect from 1893-1896.

The CHRS has identified this building "Orange" due to possession of an architectural feature(s) or historical association that has made it potentially significant in the context of the surrounding community. It was constructed primarily of red brick with limestone foundations and decorative elements. It uses a classical revival vocabulary with venetian gothic detailing including decorative and dentiled cornices, pilasters with Corinthian capitals, corner quoins, arched windows, decorated framed entrances, and limestone cartouches. The two main east west entrances are framed by arched openings with carved foliate scrollwork in the spandrels. The spandrels between first and second floor windows are filled with a brick checkerboard pattern and further adorned with small terra cotta fleur de lis. The arched third floor windows are crowned with limestone ogee arches. Masonry above these arches is of a highly ornate curvilinear pattern. Attic windows above are framed by limestone arches flanked by hexagonal columns with hexagonal capitals. The building retains architectural integrity and is excellent example of Classical Revival design, it is recommended eligible for NRHP listing under Criterion C for architecture.

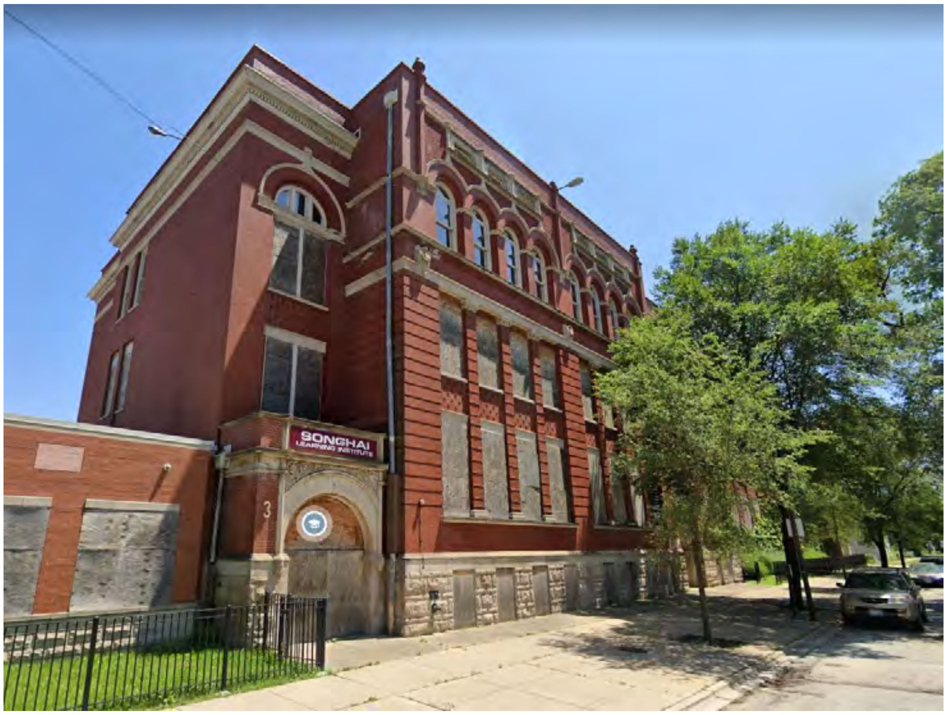

Figure 4-6: West Facade, Scanlan Elementary, 11725 S. Perry Avenue

George William Curtis Public School, 11445 S. State Street

This Classical Revival style school in the Roseland community was built in 1893. It is an excellent example of a Chicago Public School design by W. August Fiedler. An incredibly prolific designer, Fiedler designed 58 new school buildings as Chicago Board of Education Architect from 1893-1896.

The original building along State Street was constructed primarily of red brick with rusticated limestone foundations and decorative elements. It uses a classical revival vocabulary with fluted engaged pilasters, Doric and Ionic capitals, limestone cornices, sills, and lintels, arched windows over secondary entries, and checkerboard brickwork at parapets also over secondary entries. Additions to the building occurred in 1906, 1974, and 2009. The building retains architectural integrity and is excellent example of Classical Revival design, it is recommended eligible for NRHP listing under Criterion C for architecture.

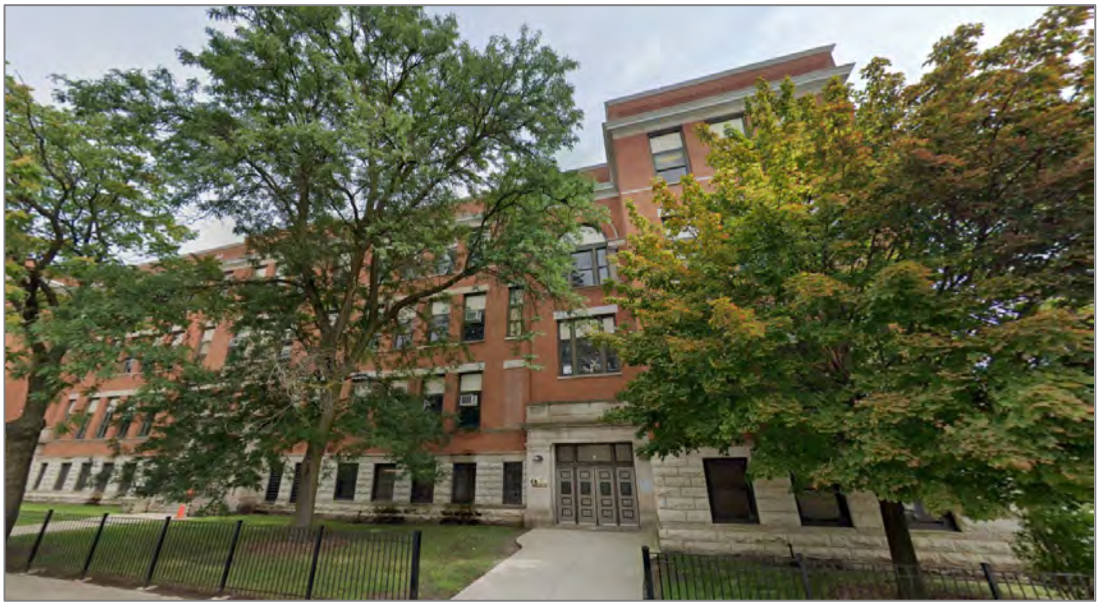

Figure 4-7: George William Curtis Public School, 11445 S. State Street

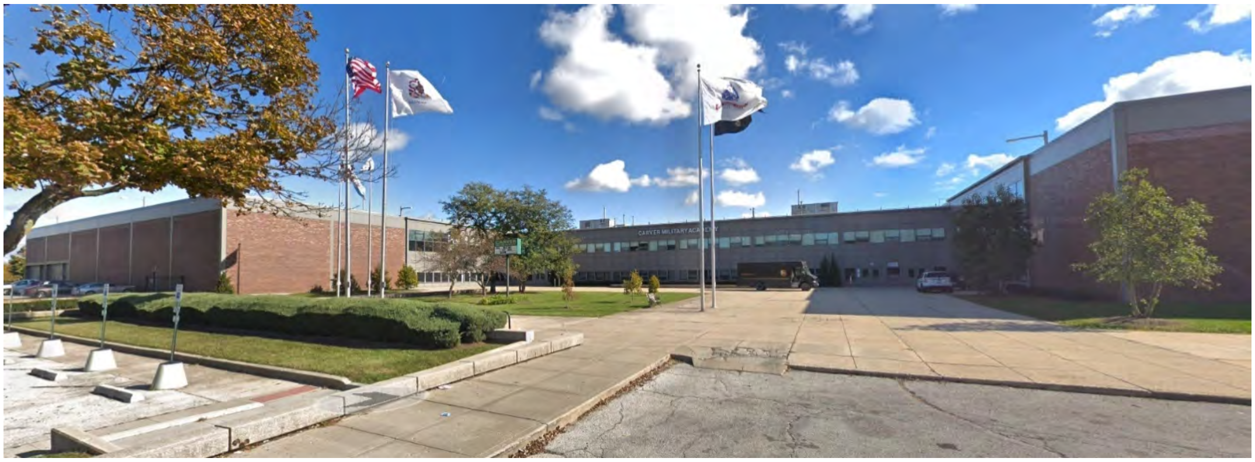
Carver Military Academy, 13100 S. Doty Avenue

This two-story Modernist building in the Riverdale community area was constructed in 1973. It was constructed as George Washington Carver High School to serve students from Altgeld Gardens housing complex. The design is credited to John Moutoussamy, the first African-American architect to have a partnership in a major architectural firm, Dubin, Buin, Black & Moutoussamy. He studied at Illinois Institute of Technology in 1948 under Mies van der Rohe. Influenced by this instructor, Moutoussamy designed buildings using a Modernist and Late Modernist vocabulary. His 1971 design for the Johnson Publishing Company is the only high-rise building in Chicago designed by an African-American and was designated a National Historic Landmark in 2018.

The building is a good example of Late Modernist design. Its parti is of simple geometric volumes with simple rectilinear elements and little decoration. Its lineage from the school of Mies van der Rohe is clearly evident and little has changed from its original design.

Because the building retains excellent architectural integrity, is a good example of Late Modernist design and associated with architect John Moutoussamy, it is recommended eligible for NRHP listing under Criterion C for architecture.



CARVER MILITARY ACADEMY

Figure 4-8: West Facade, Carver Military Academy, 13100 S. Doty Avenue

4.6 Surveyed Properties Recommended Ineligible

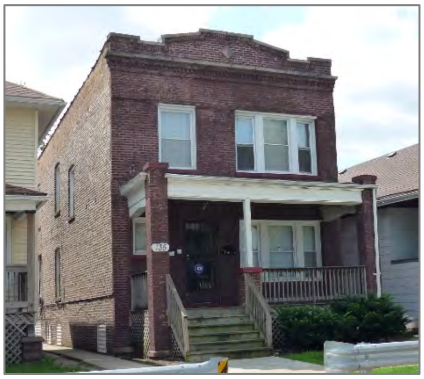
Beyond the properties that were identified as eligible for NRHP listing, eight properties were surveyed that did not meet eligibility criteria for inclusion in the NRHP. Generally, these properties have had substantial alterations that compromise their historic integrity or do not feature a level of distinctive architectural detailing necessary to qualify for the NRHP. See **Appendix A** for additional information. These properties include:

135 E. 114th Street

Year Built: 1913

Community Area: Roseland

Evaluation: This house is typical for the area, lacks distinguishing architectural features, was not associated with historical people or events, and is recommended not individually eligible for listing in the National Register.

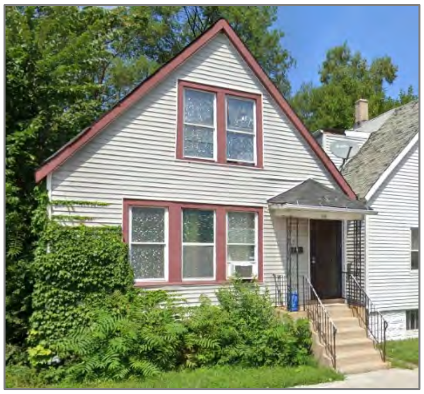


136 E. 115th Street

Year Built: c. 1900

Community Area: Roseland

Evaluation: This house is typical for the area, lacks distinguishing architectural features, was not associated with historical people or events, and is recommended not individually eligible for listing in the National Register.

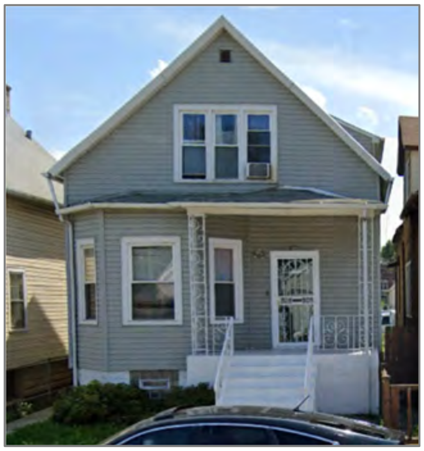


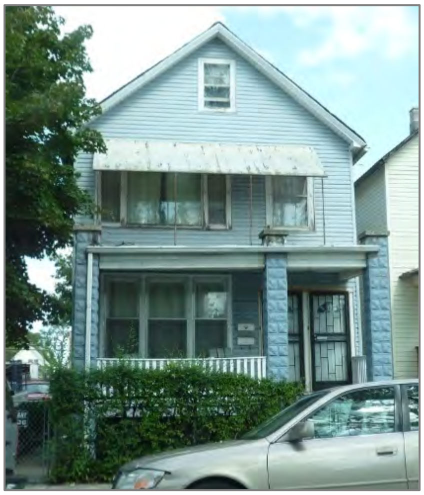
139 E. 115th Street

Year Built: 1908

Community Area: West Pullman

Evaluation: This house is typical for the area, lacks distinguishing architectural features, was not associated with historical people or events, and is recommended not individually eligible for listing in the National Register.



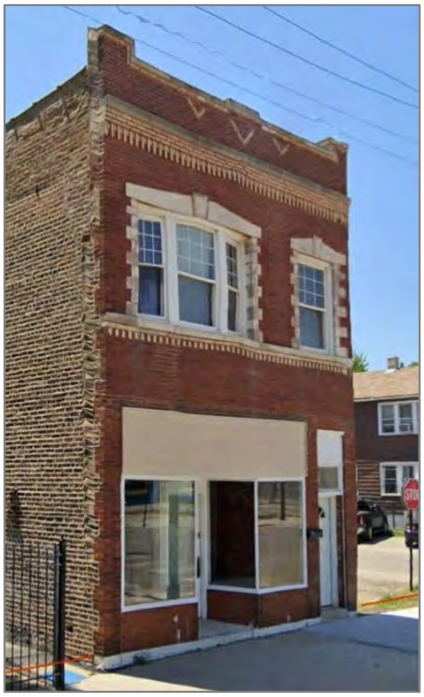


146 E. Kensington Avenue

Year Built: 1898

Community Area: West Pullman

Evaluation: This house is typical for the area, lacks distinguishing architectural features, was not associated with historical people or events, and is recommended not individually eligible for listing in the National Register.

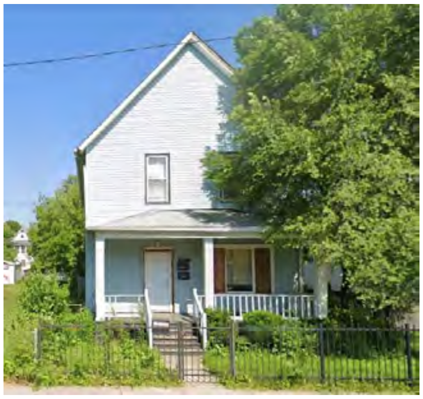


203 E. Kensington Avenue

Year Built: c. 1920

Community Area: West Pullman

Evaluation: This building lacks distinguishing architectural features, was not associated with historical people or events, and is recommended not individually eligible for listing in the National Register.



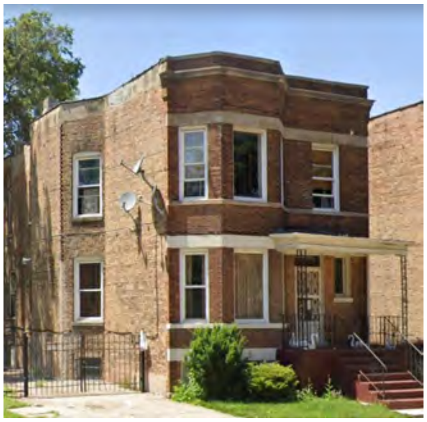
11611 S. Lafayette Avenue

Year Built: 1890

Community Area: West Pullman

Evaluation: This house is typical for the area, lacks distinguishing architectural features, was not associated with historical people or events, and is recommended not individually eligible for listing in the National Register.

11624 S. State Street

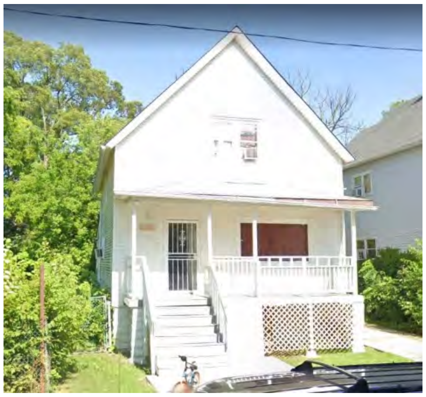


Year Built: 1910

Community Area: West Pullman

Evaluation: This house is typical for the area, lacks distinguishing architectural features, was not associated with historical people or events, and is recommended not individually eligible for listing in the National Register.

11717 S. Lafayette Avenue



Year Built: 1894

Community Area: West Pullman

Evaluation: This house is typical for the area, lacks distinguishing architectural features, was not associated with historical people or events, and is recommended not individually eligible for listing in the National Register.

4.7 Archaeological Resources

Review of historic aerials from 1900 to 1980 and Sanborn Fire Insurance Maps from 1880 to 1920 revealed the development of residential and commercial properties, and railroads along the Preferred Alignment. Archaeologically, this demonstrates that the ground has been disturbed and there is a very low chance of intact subsurface deposits.

From June 15 to June 16, 2020 Midwest Archaeological Research Services (MARS), conducted a Phase I Archaeological Reconnaissance Survey on the Preferred Alignment (**Figure 2-1**). The project area is in portions of Sections 4, 9, 16, 21, 22, 26, 27, and 35, of Township 37 North, Range 14 East (Calumet) of the Third Principal Meridian.

MARS archaeologists did not identify any cultural material within their 53 excavated shovel probes during the Phase I archaeological survey. The areas that were not amenable to survey have been disturbed over the past 80 years by commercial, residential, roadway, and rail line development.

Additionally, no archaeological sites would be affected during construction of the Preferred Alignment.

See the full Archeological Resources report in **Appendix C**.

INTEGRITY:. Unmodified Some Modification [✓ Major Modifications]

Notes/Description – First floor storefront has been completely replaced and new masonry used to infill. Second story windows have been removed and/or covered. Terra cotta ornamentation has been significantly altered and large portions removed.

CONDITION: Excellent [✓ Good/Fair] Poor

Notes/Description – Building appears to be in fair condition.

ARCHITECTURAL STYLE: Commercial Storefront, with Sullivanesque Elements
FOUNDATION: Masonry
WALLS: red brick, white terra cotta
WINDOWS: Non-historic vinyl
ROOF TYPE: flat with raised parapet
ROOF FEATURES: N/A
ROOF MATERIAL: N/A

OUTBUILDINGS (# AND DESCRIPTION) None

PROPERTY DESCRIPTION

11431-3 S. Michigan Avenue is a two-story commercial storefront building at the southeast corner of S. Michigan Avenue and 114th Street. The building's front (west) facade faces Michigan Avenue; its north elevation faces 114th Street, the rear of the building faces an alley to the east, and the south elevation is attached at the west by a party wall to the building located at 11437 S. Michigan Avenue. There are two inset double-door replacement storefront entries on the west facade and a service entrance with driveway access at the east end of the north elevation. The roof is flat.

The walls of the building are red brick. The first story of the front facade has been significantly altered, with replacement brick and storefront windows that extend to western side of the first floor north elevation. The second story appears to be older replacement brick. A slightly raised parapet wall on the front elevation extends to the west portion of the north elevation. Ornamentation of the building consists of white terra cotta on the west and north elevations.

On the front elevation, a terra cotta belt course runs below the second story windows and double rows of white terra cotta form an additional belt course on top of the windows. Four white terra cotta panels vertically divide the boarded-up second story windows and serve as pilasters, with Sullivanesque ornamentation. The two pilasters in the middle have stylized, flared capitals with oval shields on top of a single vertical row of ornamental terra cotta, the two on the north and south ends do not have capitals. The intricately patterned, curvilinear and entwined decorative ornamentation on the terra cotta pilasters is more elaborate on the pilasters on the north and south ends. Near the roof line, bands of Sullivanesque terra cotta panels bracket two replacement white terra cotta squares. A raised, projecting terra cotta eagle is prominently placed in the middle of, and rises above, the roof line.

The belt course that runs below the second story windows on the front elevation continues along the north elevation, and the west side features two unadorned shields. A horizontal band of small, repeating blocks of rectangular decorative panels runs along the north elevation above the second-story windows. The site of the property is sloped, and basement windows appear on the east side of the north elevation. Windows are replacement double-hung simple punched windows with thick sills. A red brick chimney rises from the north elevation.

The east elevation faces an alley and the walls are common brick. A third floor rises along the south side. Windows from the basement, first, second, and third floors are arched. The windows along the south end of the east elevation are smaller than those on the north end. Several windows have bars and most are boarded- up.

The south elevation walls on the east side are common brick. The windows are arched; and many are bricked-in, and the remaining have bars.

HISTORY/DEVELOPMENT

A. Vincent, Original Owner

On October 23, 1897, a permit was issued to allow Vincent & Johnson to build a one-story and basement brick blacksmith shop for $1,200.00. In 1904, Alfonse Vincent was working at 11431 Michigan Avenue in the wagon trade, maintaining a carriage and wagon factory that manufactured milk and other wagons. On April 29, 1911, a permit was issued to allow A. Vincent to construct the present building located at 11431–3 S. Michigan Avenue. By 1913, a related entity named A. Vincent & Sons was engaged in the wagon trade, manufacturing milk and other wagons, as well as in the automobile industry. It is not known if the company manufactured automobile parts, serviced and/or sold automobiles at that time. By 1921, the business had expanded; A. Vincent was listed at 11431 S. Michigan Avenue and Vincent Bros. was located at 11354 S. Michigan Avenue, both companies in the harness & carriage trade. Advertisements from the period indicate that the companies were also engaged in automobile sales. It is not clear when the family company ceased to make wagons and concentrated solely on selling automobiles.

The family was French Canadian, and multiple extended family members worked for the family businesses and lived along the 11000 block of S. Michigan Avenue. Arthur Frederick Vincent, who was born on July 15, 1896, lived at 11337 S. Michigan Avenue in 1910, and in 1917 he lived at 11437 S. Michigan Avenue. He worked for A. Vincent & Sons at 11431 S. Michigan Avenue and was foreman of a garage. His father Alfred was the manager of a carriage factory. By 1930, Arthur was part owner in auto sales. Arthur's son was Orville A. Vincent, and the two were in the carriage business at the property, which was later occupied by the Bass Furniture company. According to Orville Vincent's obituary, Arthur and Orville opened the first automobile sales agency in Roseland and later constructed another building at 120 E. 115th Street.

Architect J.T. Fortin

Joseph T. Fortin was born on January, 1871 in Canada. Like the Vincent family, Fortin was French Canadian, emigrating to the United States in 1886. J. T. Fortin designed a large number of residential and commercial buildings in Chicago and surrounding suburbs. Commercial buildings that Fortin designed include the Colonial Trust & Savings Bank at 2218 S. Michigan Avenue, currently located in the Chicago Motor Row Landmark District. Among his more notable designs is Saint Louis De France Catholic Church, 117th Street and State Street, for Rev. Father Jules C. Fortin, possibly a family member. Fortin maintained his offices on the South Side of Chicago; in 1907 he was listed as working at 7 Blue Island Avenue, and in 1921 his office was located at 600 Blue Island Avenue in Chicago. He was a member of the Illinois Society of Architects.

PROPERTY DESCRIPTION

11445-7 is a classical three-bay wide building, visually divided by a center section flanked by two side sections with projecting bays. The building has storefronts on the first floor and residences above. 11445 is on the north side of the building and 11447 is on the south side of the building. The front facade faces Michigan Avenue on the west, the north elevation faces a vacant lot, the south elevation is a party wall that adjoins 11451 S. Michigan Avenue, and the east elevation faces an alley. Entrances to the building include a recessed storefront entry on the north side of the west elevation, a boarded-up door on the south side of the west elevation, and multiple entrances from a multi-level wood porch on the east elevation.

The walls of the front (west) elevation are Indiana limestone, mostly rusticated, but smooth above the second story windows. The walls of the north, east and south elevations are brick; the second floor of the north elevation has a section of wood and replacement brick. This north elevation wall may have been a party wall. The storefront on the north side of the front elevation is a metal-framed glass storefront with a recessed entry; the south side of the front elevation is boarded-up.

A limestone belt course runs below and above the second story windows. Ornamentation of the building includes a thick belt course projecting above the second story windows with brackets covered with cyma reversa with acanthus leaf molding that runs across the entire front facade, and a large triangular pediment above the second floor on the center section, decorated with a limestone laurel wreath, foliate and ribbons.

Windows on the second floor are replacement double-hung windows in simple, punched openings. There is one non-historic double hung window on the second floor of the north elevation. Windows and doorways on the east elevation are replacement in arched openings, some have bars. Covered wood porches with interconnected stairs lead to the fenced-in back yard. The site is sloped, and the basement level of the north wall is faced with historic stone.

HISTORY/DEVELOPMENT

The August 15, 1903 *American Contractor* journal announced that a building permit was granted to owner Sam Fisher to build a building at 11445 and 11447 S. Michigan Avenue. The architects would be Burtar & Gassmann.

In January of 1919, it was announced that a new enterprise named Roseland Trunk Works was located at 11445 S. Michigan Avenue. The building was for sale in 1937, and from 1945 through 1950, the Roseland Thrift Shop operated in the storefront as the principal fundraising source for the Infant Welfare Society located in the Beverly neighborhood of Chicago. Later in 1950 the building was leasing a “large, well located store, 25’ X 65’ ” at the property and the Roseland Thrift Shop had moved across the street to 11446 S. Michigan Avenue. The 1953 City of Chicago Directory published by the Chicago Cross Reference Association did not list a business at the address. Residents who lived above the store front at 11445 include Lanis Crouse in 1913, Anthony Trovante in 1940 and Dr. E.A. Proby in 1946, and Dr. Leo H. Frigo, Rose Ragonese and Dave G. Weil in 1953.

It is not clear what was located in the storefront at 11447 S. Michigan, but in 1937 an advertisement appeared in the Chicago tribune looking for a waitress. In 1945 and 1946, the American Legion had clubrooms in the building. The 1953 City of Chicago Directory published by the Chicago Cross Reference Association listed Avenue Liquors and Dr. L. Frigo as businesses located at 11447. At some point, Greater Change Cathedral occupied the site. Residents who lived above the storefront at 11447 include Dr. Abraham H. Lifchitz in 1908 through 1912, and Hugh R. Quinn in 1953.

Burtar & Gassmann

Six buildings designed by Burtar & Gassman are listed orange on the Chicago Landmarks historic survey as potentially possessing significant architectural or historical features, including two two-flat buildings designed by Burtar & Gassmann in 1905 at 2715 W. and 2741 W. Logan Boulevard which are listed as contributing structures to the Logan Boulevard Historic District listed on the National Register of

Historic Places and included as notable in the AIA Guide to Chicago *Logan Boulevard Graystones*, the area of Chicago's "finest and most easily viewed collection of graystones."[1]

OUTBUILDINGS (# AND DESCRIPTION): None

PROPERTY DESCRIPTION

11451 S. Michigan Avenue is a commercial corner storefront building that is located on the southeast corner of S. Michigan Avenue and 115th Street. The west elevation runs along Michigan Avenue, and has a party wall that joins 11445-7 S. Michigan Avenue on the north. The south elevation faces 115th Street, and the east elevation faces an alley. There appear to be two main entries to the building: a recessed corner entry to the building is located at the southwest corner of the building, and faces southwest, and another entrance is located in a storefront window on the north side of the west elevation. An addition is located at the rear (east) of the building along 115th Street.

The walls of the building are covered with rectangular terra cotta panels: white on the walls and black along the sidewalk. Fenestration is boarded-up, but openings include a large storefront window on the west elevation, and another which wraps around the southwest corner along the west and south elevations. Divisions appear to be metal. Additional fenestration on the south elevation consists of boarded up octagonal openings. There is one steel-framed divided window on the east elevation facing northeast, the remaining windows on the are filled-in with masonry.

Consistent with early Art Deco commercial buildings, 11451 S. Michigan Avenue is stripped down to its purest form with applied ornamentation. The storefront windows are the predominant feature, emphasized by applied gold painted terra cotta surrounding the windows, a stringcourse at the roof lines, and decorative elements applied to the terra cotta on the walls above storefront windows. Ornamentation is classical, with an Art Deco influence. The ornamentation surrounding the storefront windows and over the corner entry openings consists of low-relief swags, ribbons, floral elements and small anthemion flowers. Circular terra cotta elements applied to the terra cotta walls above the storefront windows but below the roofline string course are stylized floral elements bracketed with scrolls and floral elements. The roof line ornamentation is the most dramatic, and consists of a string course with two bands of decoration with arched projections over the roof line, emphasizing verticality. A band of Greek key panels with square panels decorated with anthemion panels is surmounted by a second band of outlined rectangular panels, and projecting shields with lozenges and anthemion flowers.

HISTORY/DEVELOPMENT

On March 22, 1925, the *Chicago Tribune* announced that a one-story and basement building would be built on the northeast corner of Michigan Avenue and 115th Street, to be used as a furniture store. Teninga Brothers & Co. was a real estate brokerage firm, located at 11324 S. Michigan Avenue in 1933. Cornelius Teninga, who lived at 10718 S. Normal Avenue in the Pullman neighborhood, was president of Teninga Bros. Cornelius Teninga graduated from the University of Chicago, among other things, was a licensed attorney, president of Teninga Brothers & Co., vice president of the Roseland National Bank, and secretary-treasurer of the Roseland Standard Building and Loan association, which constructed a building at the southwest corner of 113th Street and Michigan Avenue in 1931. Established in 1895, the Teninga Brothers Co. continues to operate today as Teninga-Bergstrom Realty Co., a realty company focusing on apartment leasing and property management throughout Chicago’s South Side.

Over three years after the *Chicago Tribune* article announcement, a permit was issued on May 10, 1928, allowing construction of the building at 11451-5 S. Michigan Avenue. Loewenberg & Loewenberg were listed as architects. In 1929, the property was occupied by Sadock & Adelman, a furniture store. By 1953, Gordon Furniture & Rugs occupied the property, but went out of business in 1954 and Waldorf’s, a chain of furniture stores, was operating in the building in 1957. In 1989, the building was occupied by the Canella School of Hair Design.

Loewenberg & Loewenberg, architects

Structural engineer Max L. Loewenberg was born in Russia on November 29, 1889, and architect Israel Sidney Loewenberg was born in Libau, Lithuania on June 22, 1892. The two brothers emigrated to the United States and both graduated with Bachelor of Science degrees from the Armour Institute of Technology, now known as the Illinois Institute of Technology. In 1919, they formed Loewenberg & Loewenberg, an architectural firm, and were principal partners together, starting with designs of residential apartment hotels, small storefronts, and a number of buildings for Jewish institutions. The firm grew and is practicing today as Loewenberg Architects, concentrating on high-rise apartment buildings in Chicago.

HISTORIC RESOURCE SURVEY FORM

RESOURCE TYPE Building
ADDRESS 139 E. 115th Street

PROJECT NAME CTA Red Line Extension
PROJECT NUMBER 2009

INTEGRITY: Unmodified [✓ Some Modification] Major Modifications

Notes/Description – The original form appears to be the same as compared to the 1897 Sanborn Map, but modifications to the exterior have been made over time. Vinyl siding replaced the original siding, the windows are vinyl replacements, and the lower casement windows in the basement feature glass blocks that would not have existed in the original construction. The porch columns and railing have been replaced with decorative metal that likely dates from the 1960s-70s.

CONDITION: Excellent [✓ Good/Fair] Poor

Notes/Description – From the exterior, the house appears to be decently maintained. There are no major issues visible from the exterior.

ARCHITECTURAL STYLE: Folk Victorian
FOUNDATION: Concrete
WALLS: Frame
WINDOWS: Vinyl
ROOF TYPE: Cross Gable
ROOF FEATURES: N/A
ROOF MATERIAL: Asphalt Shingle

OUTBUILDINGS (# AND DESCRIPTION) None

PROPERTY DESCRIPTION

The house is a 1.5-story wood frame house with a basement built in a Folk Victorian Style. It is in the West Pullman Community area. Vinyl siding covers the entire house. The roof features a cross gable with a front-facing gable. There is a bay window on the front facade and a porch over the front door supported by decorative metal railing. In the front gable there is a large tri-part window. Glass block casement windows are present at the basement level. This house type was popular in the area during the early 20th century. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register

HISTORY/DEVELOPMENT

No notable history found.

Notes/Description – The front facade retains much of the original architectural features, including the decorative brickwork and stone window surrounds. The lower level storefront has been modified with a band of vinyl siding above the storefront windows.

CONDITION: [✓ Excellent] Good/Fair Poor

Notes/Description – The building appears to be in good condition. No major signs of deterioration are apparent. A full inspection of the current condition was not conducted

ARCHITECTURAL STYLE: Commercial Vernacular
FOUNDATION: Masonry
WALLS: Brick Masonry
WINDOWS: Vinyl
ROOF TYPE: Parapet
ROOF FEATURES: Decorative front parapet
ROOF MATERIAL: N/A

OUTBUILDINGS (# AND DESCRIPTION) This parcel is ½ the depth of this block and contains only the building described below. A one-story wood framed residence occupies the adjacent parcel to the south.

PROPERTY DESCRIPTION
The building is a mixed-use commercial and residential building with a first floor storefront and residential flats in the rear first floor and entire second floor. It is located in the West Pullman Community area. The building features brick construction with a deep red face brick on the front-façade and rough brick on the other three facades. The storefront has display windows with a central front door, as well as a side door leading to the upper level flats. The upper level of the front facade has decorative brickwork at the cornice and beneath the window sills. Decorative stone surround the upper level windows. This building type is prevalent throughout the city including several on along this street which contains a mix of residential and commercial buildings. This building lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

ROOF MATERIAL N/A

OUTBUILDINGS (# AND DESCRIPTION) None

PROPERTY DESCRIPTION

This building is four story building that is a part of the George William Curtis Public school (Chicago Public Schools). It has a red brick façade with rusticated stone base and limestone lintels and cornice. Windows are double hung replacements. Entrances are set of 4 double doors (replacements) surrounded by limestone columns and entablature. The building appears to be in good condition. Modern brick additions exist to the east and have little architectural character.

The building was mentioned as a comparable school in the West Pullman Elementary School National Register of Historic Places Registration Form. While the building originally was designed in a Romanesque and Classical Revival style, the building received additions in 1906 and 1974, and in 2009 the 1893 and 1906 portions of the building were renovated.

HISTORY/DEVELOPMENT

The original building at 11445 S. State Street was designed by W. August Fiedler. Fiedler immigrated from Germany to the US in 1871. After working as an architect in New York City, he moved to Chicago in 1874 due to its rapid growth at that time. In the 1880s, Fiedler formed an architectural practice with John Addison. In 1893, Fiedler was appointed Chicago Board of Education Architect. During this three-year appointment, Fiedler designed 58 new school buildings throughout the city.

The building opened in 1893, with Thomas Hill as principal. Mr. Hill remained principal until 1925. The building operated as a combination elementary school and high school. The high school, known as Fenger High School, occupied the lower floors of the building, and the elementary school, known as Curtis school, occupied the upper floors. In 1910, the high school had 310 students and the elementary school had 1120 students. In 1926 Fenger High School was built at 112th St and Wallace, and high school classes were transferred to the new school. A junior high school was maintained at Curtis School until 1933. Not long after, the school became an all-elementary school.

On September 1, 1892, the *Inter Ocean* reported that Miss Burt, a member of the School Board, presented a resolution naming a new school building in honor of George William Curtis, best known as editor of *Harper's Weekly*, who had died in August of that year. The nomination was adopted. The school building would be located at Michigan and Stanwood Avenues in the Kensington neighborhood. The building was constructed in 1893, designed by Chicago Board of Education architect W. August Fiedler in the Romanesque and Classical Revival styles.

In 1903, the Iroquois Theater burned in Chicago and 41 teachers from 32 Chicago Public Schools who were in attendance lost their lives, including Amy Owens, a teacher from Curtis School, and her mother Frances E. Owens. Chicago Public Schools were closed in memoriam until Tuesday, January 5, 1904.

In 1906, the Chicago Board of Education architect Dwight H. Perkins announced that the Curtis School would receive an addition of 12 rooms and a hall, the cost of which would be $200,000.

In December of 1931, a fire occurred in the northwest wing of the school. The damaged wing wasn't re-built, and the space was converted into a playground.

PROJECT NAME CTA Red Line Extension
PROJECT NUMBER 2009

INTEGRITY: Unmodified [✓ Some Modification] Major Modifications

Notes/Description – Siding, windows, and doors have all been replaced. Porch handrail/balustrade have been replaced.

CONDITION: Excellent [✓ Good/Fair] Poor

Notes/Description – Generally the building appears to be in fair condition. Some bowing at the front porch roof.

ARCHITECTURAL STYLE: Vernacular
FOUNDATION: Masonry
WALLS: Vinyl siding
WINDOWS: Replacements
ROOF TYPE: Front Gabled
ROOF FEATURES: Brick chimney
ROOF MATERIAL: Asphalt Shingles

OUTBUILDINGS (# AND DESCRIPTION)

None. Appears to have been recently demolished.

PROPERTY DESCRIPTION

This is a typical 2-flat wood frame building in the West Pullman Community area. This type of building was constructed in masse in this area near the turn of the 20th century. This house type is common along this and adjacent blocks. Many of the original features of the building envelope have been replaced or covered, but the overall building form remains intact. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

HISTORY/DEVELOPMENT

No notable history found.

OUTBUILDINGS (# AND DESCRIPTION)
None.

PROPERTY DESCRIPTION

The property at 11725 S. Perry Avenue is located at the center of the block between 117th Street and 118th Street between S. Perry Avenue and S. Lafayette Avenue. Its main façade faces west and there is a paved lot to the east. A one-story 20th-century addition is located at the north end of the original building.

The original three-story building was built in 1897 as a Chicago Public School. It was constructed primarily of red brick with limestone foundations and decorative elements. It uses a classical revival vocabulary with venetian gothic detailing including decorative and dentiled cornices, pilasters with Corinthian capitals, corner quoins, arched windows, decorated framed entrances, and limestone cartouches. The two main east west entrances are framed by arched openings with carved foliate scrollwork in the spandrels. The spandrels between first and second floor windows are filled with a brick checkerboard pattern and further adorned with small terra cotta fleur de lis. The arched third floor windows are crowned with limestone ogee arches. Masonry above these arches is of a highly ornate curvilinear pattern. Attic windows above are framed by limestone arches flanked by octagonal columns with octagonal capitals.

Architecturally, the school is very similar to the original (1894) West Pullman Elementary School which is approximately 1 mile southwest and has been designated a City of Chicago Landmark.

The building is listed in the Chicago Historic Resources Survey as Orange for possession of potentially significant architectural or historical features. Due to its architectural significance and integrity, it is recommended eligible for listing in NRHP under Criteria C for architecture.

HISTORY/DEVELOPMENT

The original building at 11725 S. Perry Avenue was designed by W. August Fiedler. Fiedler immigrated from Germany to the US in 1871. After working as an architect in New York City, he moved to Chicago in 1874 due to its rapid growth at that time. In the 1880s, Fiedler formed an architectural practice with John Addison who was known for his “Modern Gothic” designs. In 1893, Fiedler was appointed Chicago Board of Education Architect. During this three-year appointment, Fiedler designed 58 new school buildings throughout the city.

The school operated as Scanlan Elementary until 1997 when it was converted into Songhai Learning Institute. In 2013, along with many other Chicago Public Schools, the school was closed. It remains vacant today.

OUTBUILDINGS (# AND DESCRIPTION)
None.

PROPERTY DESCRIPTION
This is a two-story building in the Riverdale Community Area. It is composed of 3 box-shaped volumes which are shifted east and west on a north-south axis where they connect. The facade of the central volume is clad in strips of windows at each story with metal panels between. North and south volumes are primarily clad in expanses of brick in concrete with no windows. The main entrance is to the west where a courtyard and drop-off area are located. Parking is located to the west and south of the building. Remains of athletic fields (track/football field and baseball diamonds) are present but not currently maintained. There have been no additions to the original building.
Stylistically, the building is of late Modernist design. It is of simple geometric volumes with rectilinear elements and little to no decoration. Its lineage from the school of Mies van der Rohe is clearly evident.

HISTORY/DEVELOPMENT
This building was designed by Chicago architectural firm Dubin, Dubin, Black & Moutoussamy. It was constructed in 1973 for Chicago Public Schools as George Washington Carver High School to serve students in the Altgeld Gardens housing complex. In 2000 it was converted into a public military academy.

The design is credited to John Moutoussamy, the first African-American architect to have a partnership in a major architectural firm, Dubin, Buin, Black & Moutoussamy. He studied at Illinois Institute of Technology in 1948 under Mies van der Rohe. Influenced by this instructor, Moutoussamy designed buildings using a Modernist vocabulary. His 1971 design for the Johnson Publishing Company is the only high-rise building in Chicago designed by an African-American and was designated a National Historic Landmark in 2018.

Section 1
Summary

This document summarizes information previously provided on the results of technical analysis on potential historic and cultural resources affected by the Chicago Transit Authority (CTA) Red Line Extension (RLE) Project and consultation conducted under Section 106 of the National Historic Preservation Act (NHPA). Because CTA narrowed the selection of alternatives under evaluation during project development (see **Attachment 1**) after Section 106 consultation had significantly progressed, this document has been developed to provide the Illinois Historic Preservation Agency (IHPA) with a streamlined and concise summary of the Area of Potential Effect (APE) for the project and eligibility and effects determinations made to date by the Federal Transit Administration (FTA). All Section 106 findings on alternatives considered that are presented in this document are consistent with previous correspondence and materials provided during the Section 106 consultation process.

1.1 Regulatory Framework

Cultural and historic resources are protected by various federal regulations; Section 106 of the National Historic Preservation Act (NHPA) requires federal agencies to consider effects on historic resources from their actions and to balance preservation needs with the need for the actions. As provided in 36 CFR § 800, the Section 106 process "seeks to accommodate historic preservation concerns with the needs of federal undertakings through consultation" (36 CFR § 800.1(a)). The goal of the consultation is to identify historic properties potentially affected by the undertaking, assess project effects, and seek ways to avoid, minimize, or mitigate any adverse effects on historic properties.

For the Section 106 assessment of historic and archaeological resources, FTA and CTA conducted a four-step process following requirements of 36 CFR § 800:

1. **Define the Area of Potential Effects** - FTA and CTA first determined an APE for cultural/historic resources. The APE is defined as the geographic area within which the project may cause alterations in the character or use of historic properties. Development of the APE involved site visits and a review of aerial photography images and conceptual engineering drawings for the alternative.

2. **Identify Historic and Archaeological Resources** - After an extensive records check, representative samples within the APE footprint were field-surveyed to identify any archaeological resources and historic resources that meet National Register of Historic Places (NRHP) criteria. Representative samples were used to determine effects on similar properties on a block-by-block basis. The properties included in the representative sample were determined using GIS databases provided by the City of Chicago, the Historic and Architectural Resources Geographic Information System, online mapping resources, State Historic Preservation Office (SHPO) records, and field visits. Additional details about the definition of the representative sample, and resources in it, are included in **Section 3** of

this report. NRHP criteria are defined in 36 CFR § 60.4 and apply to districts, sites, buildings, structures, or objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association with one or more of the following four criteria:

- Criterion A - Events that have made a significant contribution to the broad patterns of American history on a federal, state, and/or local level
- Criterion B - Lives of persons significant in the history of the city, state, and/or the United States
- Criterion C - Distinctive characteristics of a type, period, or method of construction, or the work of a master, or high artistic values, or a significant and distinguishable entity whose components may lack individual distinction
- Criterion D - Information important in prehistory or history

FTA and CTA identified properties listed on the NRHP, local landmarks, and Chicago Historic Resources Survey (CHRS) "Red" and "Orange"-rated[1] buildings (properties with locally designated historic importance). FTA and CTA conducted background research to assist this process, using the Historic and Architectural Resources Geographic Information System and city records, fire insurance and other historic maps, the CHRS, previous architectural studies in the area, and other relevant scholarly publications. No properties or districts currently listed on the NRHP are present in the APE.

3. **Assess Effects on Historic and Archaeological Resources** - FTA and CTA assessed effects for each evaluated resource that was listed in the NRHP or determined eligible for listing. The effects analysis included review of specific direct and indirect impacts that were evaluated for the project (for topics such as displacements, noise, and visual impacts) and focused on how the alternative might alter the characteristics that qualify properties for inclusion in the NRHP.

4. **Resolve any Adverse Effects** - FTA and CTA will develop any necessary mitigation measures through consultation with the SHPO and other consulting parties to address adverse effect determinations. Based on the results of the assessment of effects conducted, there would be no adverse effects to historic properties resulting from the project and no additional mitigation measures are proposed.

---

[1] The CHRS is an inventory of architecturally and historically significant buildings in the City of Chicago that uses a color-coded ranking system used to identify historic and architectural significance relative to age, degree of external physical integrity, and level of possible significance. The two highest color codes are "Red" and "Orange." These types of local historic resources are subject to the City of Chicago's Demolition-Delay Ordinance. "Red" or "Orange"-rated properties were identified as possessing some architectural feature or historical association that made them potentially significant in the context of the surrounding community.

1.2 Section 106 Consultation History and Evolution

In accordance with requirements for consultation established in Section 106 of the NHPA, three distinct rounds of coordination occurred during the RLE Project: initiation activities, identification of historic properties, and assessment of effects. In August 2012, FTA and CTA invited 11 Native American tribes and 19 state and local preservation interest groups to participate in the upcoming consultation process. At present, 11 groups are participating in the process. On October 24, 2012, FTA and CTA held a webinar on RLE historic properties to introduce the project and initiate the consultation process.

As part of the eligibility phase, CTA surveyed 541 potentially eligible resources within the APEs for all alternatives being studied at the time (Bus Rapid Transit [BRT], Union Pacific Railroad [UPRR], and Halsted Alternatives). FTA and CTA provided draft materials on the identification of NRHP-eligible properties to consulting parties on January 4, 2013 and followed it with an in-person meeting on January 30, 2013. As a result of the field investigations and comments received from consulting parties on potentially eligible resources, for all alternatives, 15 total resources were identified as eligible for inclusion on the NRHP, including 13 individual buildings and 2 historic districts.

FTA and CTA mailed a Draft Effects Report to consulting parties on April 18, 2014, requesting any written comments by May 23, 2014. On May 8, 2014, FTA and CTA met with consulting parties to discuss potential project effects on NRHP-eligible historic properties.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Alternative.

CTA had originally considered three alignment options for the UPRR Alternative: the Right-of-Way Option, the East Option, and the West Option. In 2014, the Right-of-Way Option was removed from consideration as it is no longer feasible. This option was added in 2012 in response to the CDOT feasibility study looking at moving UPRR freight operations out of the existing UPRR corridor before the RLE Project. The Right-of-Way Option would only be feasible if the separate project were implemented before implementation of the RLE Project. Coordination between local agencies and the railroads indicted that relocation of UPRR freight operations from this corridor presents considerable challenges; therefore, this option is no longer feasible. Because the Right-of-Way Option is not feasible, the Draft EIS evaluates only the East and West Options for the UPRR Alternative.

Additional conceptual engineering was conducted on the UPRR Alternative to refine the East and West Option alignments. In addition, CTA is now considering only the South Station Option of the 130th Street Station.

CTA provided responses to all consulting party comments received in May 2014 on November 23, 2014. Responses noted that the alternatives had been further narrowed and that the UPRR Alternative (East and West Options) were proposed to move forward as the NEPA Preferred Alternative.

1.3 Organization of this Report

The following sections of this report provide further details on development of the APE and eligibility and effects determinations made and presented during the Section 106 consultation process for this project.

Section 2 of this report provides a brief description of the No Build and Build Alternative (the UPRR Alternative) under consideration and details on identification of the APE.

Section 3 of this report provides a summary of the methodology undertaken to identify potentially affected historic and archaeological resources.

Section 4 of this report provides details on eligible historic and archaeological resources identified.

Section 5 provides details on the effects determinations for the East and West Options of the Build Alternative.

Section 6 summarizes the Section 106 consultation process conducted at each stage of the four-step Section 106 consultation process.

Section 2
Project Description and Area of Potential Effect

The RLE Project would extend the Red Line from the existing 95th Street Terminal to 130th Street. The proposed 5.3-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus and parking facilities.

The RLE Project would reduce commute times for residents, improve mobility and accessibility, and provide connection to other transportation modes. The RLE Project could also foster economic development, where new stations may serve as catalysts for neighborhood revitalization and help reverse decades of disinvestment in local business districts. The RLE Project would also provide a modern, efficient car storage yard and shop facility.

CTA undertook an extensive Alternatives Analysis process from 2006 to 2009 that considered multiple modes and corridor options for the RLE Project. The Chicago Transit Board designated the UPRR Alternative as the Locally Preferred Alternative on August 12, 2009. During 2012–2014 and as part of the Draft EIS analysis, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the BRT Alternative (along Michigan Avenue), the UPRR Alternative, and the Halsted Alternative. CTA evaluated three options for the UPRR Alternative: the Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Alternative 130th Street station: a South Station Option and a West Station Option. The Section 106 analysis and consultation was performed during 2012–2014,on all those alternatives and options. As further described in **Section 2.3**, CTA developed separate APEs for each alternative.

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Alternative. While CTA had originally considered a UPRR Right-of-Way Option, this was subsequently removed as it is no longer feasible. This option was added in 2012 in response to the CDOT feasibility study looking at moving UPRR freight operations out of the existing UPRR corridor before the RLE Project. The Right-of-Way Option would only be feasible if the separate project were implemented before implementation of the RLE Project. Coordination between local agencies and the railroads indicted that relocation of UPRR freight operations from this corridor presents considerable challenges; therefore, this option is no longer feasible.

Because the Right-of-Way Option is not feasible, the Draft EIS evaluates only the East and West Options for the UPRR Alternative. CTA has chosen to move forward with the South Station Option at 130th Street based on technical analysis and public feedback. As further described in **Section 6**, the consulting parties were notified of the NEPA Preferred Alternative in November 2014 as part of the responses to consulting party comments on assessments of effect.

Additional details on the alternatives development process and history, including the entirety of alternatives evaluated between 2012 and 2014 as part of the Section 106 consultation process for this project, are provided in **Attachment 1**.

The Draft EIS focuses on the following alternatives, which emerged from the Alternatives Analysis, NEPA scoping process, and additional technical analysis and public input:

- No Build Alternative
- UPRR Alternative
  - East Option
  - West Option

2.1 No Build Alternative

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of implementing the UPRR Alternative.

The No Build Alternative represents future conditions if the UPRR Alternative were not implemented. The No Build Alternative includes all projects currently included in the fiscally constrained portion of the CMAP FY 2014–2019 Transportation Improvement Program (TIP). Projects in the TIP in the project area include renovation of the 95th Street Terminal, rail line maintenance and improvements, preservation of the North Pullman historic area, road resurfacing, coordination of traffic signal timing, and construction of a new bicycle/pedestrian facility. Impacts related to the construction and operation of the 95th Street Terminal are documented in the approved *95th Street Terminal Improvement Project Environmental Assessment* (CTA 2013b). FTA issued a Finding of No Significant Impact for the 95th Street Terminal Improvement Project in April 2013, and an Amended Finding of No Significant Impact in July 2013. FTA performed an Environmental Assessment Re-Evaluation in July 2016, which confirmed that the Amended Finding of No Significant Impact dated July 2013 remains valid. No new infrastructure would be built as part of the RLE Project under the No Build Alternative.

2.2 Build Alternative

The UPRR Alternative is shown in **Figure 2-1** and would extend the heavy rail Red Line 5.3 miles from the existing 95th Street Terminal to 130th Street. As noted above, the Chicago Transit Board designated the UPRR Alternative as the LPA at its August 12, 2009 board meeting. The UPRR Alternative would reduce transit travel times from the project area to points on the Red Line north of 95th Street (from 130th Street to 95th Street) from 28 minutes to approximately 14 minutes (CTA 2009). The following describe major aspects of the proposed alignment options under consideration, stations, park & ride facilities, 120th Street yard and shop, substations, and overview of the operations plan.

2.2.1 Alignment

Two alignment options adjacent to the UPRR are considered for this alternative: the East Option and the West Option. The CTA elevated structure would be located either east or west of the existing UPRR corridor. The alignment would follow the UPRR corridor to Prairie Avenue, where it would cross over the Canadian National/Metra Electric District (CN/ME) tracks near 119th Street. South of this point, the East and West Options would follow the same alignment southeast along the Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad (NICTD/CSS & SBRR) right-of-way using a portion of the Norfolk Southern Railway and Consolidated Rail Corporation (Conrail) right-of-way to the terminus (end) of the RLE at 130th Street.

As described, two UPRR Alternative options for the segment of the proposed alignment between I-57 and the CN/ME tracks near 119th Street are studied in the Draft EIS:

- East Option - The CTA elevated structure would be placed immediately adjacent to the east side of the UPRR right-of-way.
- West Option - The CTA elevated structure would be placed immediately adjacent to the west side of the UPRR right-of-way.

In the UPRR Alternative, the tracks would be on a new elevated (aerial) track structure from the 95th Street Terminal through the CN/ME track crossing near 119th Street. South of this elevated crossing, the tracks would transition to an at-grade profile (they would continue at ground level).

Figure 2-1: Red Line Extension Project Build Alternative

The proposed elevated structure would be a closed-deck, steel and concrete, aerial track structure with direct-fixation track and welded rail (welded at joints). With direct-fixation track, rails are mounted to specially designed concrete blocks fixed to the concrete deck. Noise barriers (approximately 4 feet in height, measured from the top surface of the concrete deck) are proposed for portions of the structure on both sides of the track deck to reduce noise transmission at and below track level. The structure would vary in height from 14 feet 9 inches to 40 feet above existing grade, depending on required clearances above existing roadways and railroads. The two tracks would have a spacing of 13 feet (13 feet between the track centerlines). The elevated deck, on which the tracks would run, would vary in width from approximately 30 feet to approximately 52 feet at stations

Figure 2-2 is a photo simulation of a typical proposed elevated structure above the UPRR right-of-way. The design shown is conceptual, and the actual design would vary based on further engineering and community input.

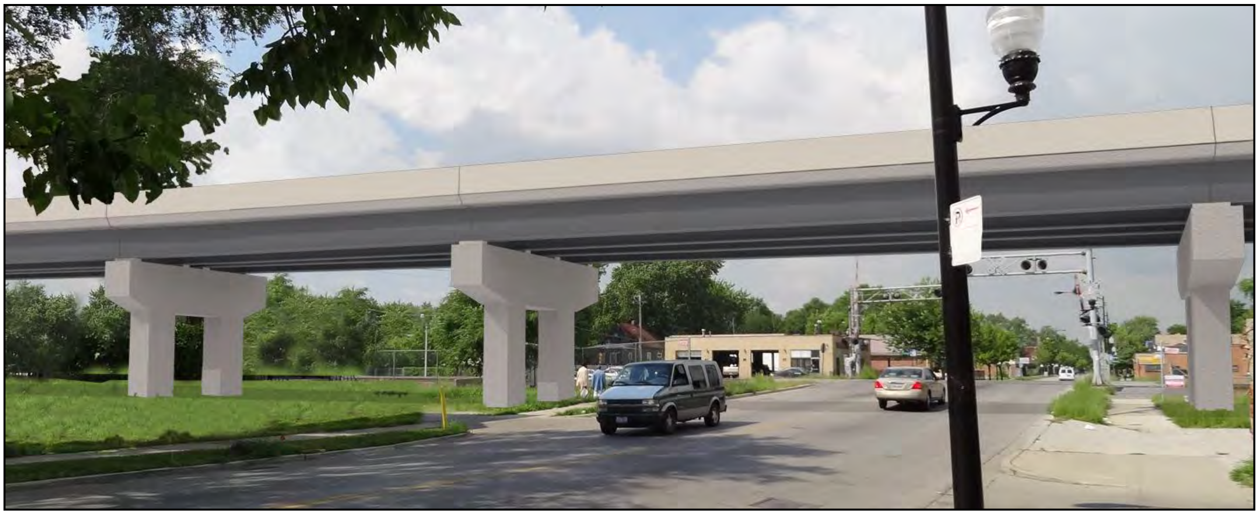

Figure 2-2: Photo Simulation of Union Pacific Railroad Alternative East Option at 111th Street Facing West - Typical Proposed Elevated Structure

2.2.2 Stations

As part of the UPRR Alternative, four new stations would be constructed at the following locations along the proposed alignment:

- 103rd Street (elevated station)
- 111th Street (elevated station)
- Michigan Avenue (elevated station)
- 130th Street (at-grade station)

Each station would have a center platform, approximately 26 feet wide and 520 feet long. Platforms would accommodate ten-car trains. Each station would be Americans with Disabilities

Act (ADA) accessible with elevators. Each station area would include areas for bus boarding, new crosswalks where needed to accommodate pedestrian traffic, and park & ride facilities. **Figure 2-3** is a photo simulation of a typical proposed station. The design shown is conceptual, and the actual design would vary based on further engineering and community input.

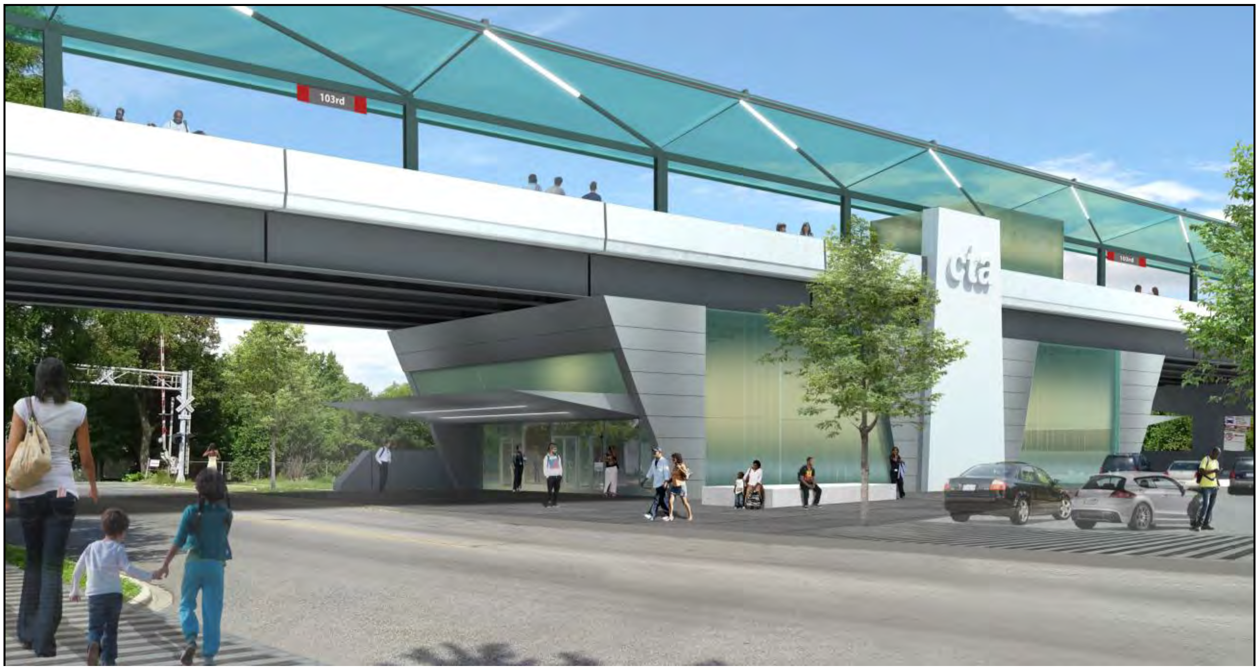

Figure 2-3: Photo Simulation of Union Pacific Railroad Alternative East Option at 103rd Street Facing Northwest - Typical Proposed Elevated Station

The 130th Street station would be located immediately west of the NICTD/CSS & SBRR right-of-way at 130th Street. Pedestrians from Altgeld Gardens would access the station from 130th Place. Pedestrians would not need to cross 130th Street to access the station because 130th Street goes over 130th Place and the railroad tracks.

2.2.3 Park & Ride Facilities

To accommodate passengers arriving at the UPRR Alternative stations by car, park & ride facilities would be constructed near each station, as described in **Table 2-1**. A total of 3,700 parking spaces would be available along the corridor. CTA estimated parking demand based on travel demand modeling performed in 2009. Bus turnarounds would be provided in the parking areas. The ground floor of the parking structure at the Michigan Avenue station would contain space for retail and community facilities.

Table 2-1: Summary of Park & Ride Facilities

Station	Number of Parking Spaces	Union Pacific Railroad Alternative East Option	Union Pacific Railroad Alternative West Option
103rd Street	200	Divided between two surface parking lots (one on the east side of the tracks and one on the west side of the tracks)	One surface parking lot
111th Street	200	Divided between two surface parking lots (one on the east side of the tracks and one on the west side of the tracks)	One surface parking lot
Michigan Avenue	1,000	Divided between a three-story parking structure and a surface parking lot (a surface parking lot on the east of the tracks and a parking structure on the west of the tracks)	Five-story parking structure
130th Street	2,300	Seven-story parking structure	

2.2.4 Yard and Shop

The 120th Street yard and shop, with a capacity of 340 train cars, would be sited on a combination of industrial and vacant land east of the CN/ME tracks and west of the NICTD/CSS & SBRR tracks near 120th Street and Cottage Grove Avenue. The yard would be entirely at grade. Parking spaces for CTA employees would be included at the yard.

2.2.5 Substations

Substations are buildings along the alignment that house equipment to regulate the flow of electricity to the third rail, which supplies power to the trains. Substations would be placed approximately 0.8 to 1 mile apart along the alignment. Six new and upgraded substation locations are proposed: 98th Street Yard and Shop, near 101st Street, near 107th Street, near Lafayette Avenue, within the 120th Street yard and shop area, and near the 130th Street station. CTA would confirm the need and location for substations during future design phases.

2.2.6 Operating Plan

The UPRR Alternative would operate 24 hours a day, each day of the year. Service frequency is anticipated to be the same as with the current service (April 2016) at 95th Street—approximately 6-minute headways during morning peak hours and approximately 3-minute headways during afternoon peak hours. Headways at night (between 1 AM and 4 AM) are approximately 13–15 minutes. Service frequency would be adjusted to accommodate demand once the RLE service has been implemented. Train frequencies would vary throughout the day (like existing Red Line service), and late night service would operate approximately every 15 minutes.

Train sets would be eight cars long. Stations and track alignment would accommodate ten-car trains to maintain the option of running ten-car trains in the future. With the extension of the Red Line, some existing bus routes would be rerouted to feed into the proposed stations.

2.3 Area of Potential Effect

In the context of Section 106, the APE is defined as “the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist” (36 CFR 800.16.d). The APE for the RLE Project was delineated after considering the location of the proposed alternative; the potential for ground disturbance, destruction, or property taking; locations from which the undertaking may be visible and/or audible; and the scale and setting of the project. The APE was developed in consultation with CTA, FTA, and IHPA.

Cultural resource specialists developed the APE boundaries for the BRT, UPRR, and Halsted Alternatives in 2012 after conducting site visits and reviewing the aerial maps and engineering details (such as alignment locations, elevation of the proposed rail line, expected right-of-way limits, and the locations of the yard, stations, and parking facilities) for the Build Alternatives. SHPO concurred on the APE boundaries on July 20, 2012.

Generally, the APEs for the UPRR and Halsted Alternatives contain parcels within one block of the centerline of the alignment. The APE widens to accommodate the locations of each park & ride and the proposed yard and shop beyond the one-block boundary. The APE for the BRT Alternative includes the area immediately surrounding park & ride facilities.

As described above, in August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Alternative. In late 2014, CTA also conducted additional conceptual engineering on the UPRR Alternative to refine the East and West Option alignments. FTA and CTA revised the APE for the UPRR Alternative accordingly and as shown in **Figure 2-4**. The revised APE presents no new effects from the UPRR Alternative than what was presented during consultation. Because the BRT and Halsted Alternatives are no longer under consideration, those APEs are no longer discussed.

Section 3
Methodology for Identification of Resources

3.1 Identification of Historic Resources

3.1.1 Background Research/Historic Context

Background research was conducted to describe the historic context for the project area. Understanding the historic context is essential in establishing the significance of individual properties, and by extension, and NRHP eligibility for the built environment. The following resources were consulted in developing the historic context and identifying known sites:

- The Historic Architectural Resources Geographic Information System (**HARGIS) database** was created by the IHPA in 2003 to manage information about Illinois historic properties; this database documents the state's built environment. The HARGIS database includes data gathered as a result of three statewide survey projects: the Illinois Historic Structures Survey, the Illinois Historic Landmarks Survey, and the Illinois Rural Survey (conducted 1970–1987). The HARGIS database also includes properties identified as part of a NRHP nomination, surveys by local preservation groups, and information from the Illinois Department of Transportation's Bridge Survey. The database includes data forms, photographs, background documentation, and spatial information within a geographical context for each historic property and historic district within the dataset.

- The **CHRS** is an inventory of buildings that was compiled during 1983–1995. The Chicago Department of Housing and Economic Development published its findings in a report titled *Chicago Historic Resources Survey: An Inventory of Architecturally and Historically Significant Structures* in 1996. Organized according to Chicago's 77 neighborhoods, the inventory lists over 17,000 architecturally and historically significant buildings and structures that predate 1940. The information is also available online and is searchable by neighborhood, building address, decade of construction, architect's name, building style and type, survey ranking, and landmark status.

- **Sanborn Fire Insurance maps** contain a wealth of information on the built environment in urban areas. Originally created and maintained to assess fire insurance liability, the maps provide dated contexts in which to describe the development of neighborhoods as well as the compositional components and historical use of individual buildings. Data especially useful for this project include the building footprint, number of stories, foundation material, and cladding material. The Sanborn maps are available online through subscription.

- **NRHP nomination forms** for individually listed historic properties and districts provide a wealth of contextual information for the individual properties and the historic districts. They include construction dates for most historic properties discussed therein and identify the architect in most instances.

Architectural datasets at the local level were reviewed as well, including information from the Commission on Chicago Landmarks.

The Commission on Chicago Landmarks recommends individual buildings, sites, objects, or entire districts to the Mayor and City Council for designation as Chicago Landmarks. To be recommended by the Commission for landmark designation, these resources must meet at least two criteria: (1) being valuable as an example of city, state, or national heritage, and (2) being historically significant—the site of a significant historic event, association with a significant person, architecturally significant, the work of a significant architect or designer, association with a significant historic theme, or a having unique visual feature. In addition, the potential landmark must maintain integrity in light of its location, design, setting, materials, workmanship, and ability to express such historic, community, architectural, or aesthetic interest or value. The Commission reviews any proposed alteration, demolition, or new construction affecting individual landmarks or properties in landmark districts as part of the permit review process. The Commission produces two new publications each year, one for individual landmarks and landmark districts and another for Chicago listings on the NRHP.

Using information in HARGIS and the other sources listed above, a list of previously identified historic and archaeologically-sensitive properties within the RLE APE was compiled and mapped. This effort included the identification of NRHP-listed districts and structures, and any properties identified as local landmarks in Chicago.

3.1.2 Surveys of Historic Resources

After the development of the APE and historic contexts, cultural resources specialists conducted field surveys on two distinct categories of properties: properties that would likely be displaced or demolished as a result of one or more alternatives, and a representative sample of other properties within the APE.

For both categories of properties that were surveyed, cultural resource specialists conducted archival research and photo-documented the exterior of each structure from the public ROW. Each property was assessed for NRHP eligibility using the data gathered during the fieldwork and research phases of the investigation.

The following subsection identifies how the representative sample in the latter category was identified. Because of the developed urban environment and linear nature of the project, effects on properties would be similar for adjacent properties. This method is consistent with November 2011 guidance provided by the Advisory Council on Historic Preservation regarding the “Reasonable and Good Faith Identification Standard in Section 106 Review.”

Defining the Representative Sample

To determine the properties to be included in the representative sample, the team’s architectural historian relied on the GIS database provided by the City of Chicago, the HARGIS database, online mapping resources, SHPO records, and field reconnaissance. Examining the APE block by block, the historic character of each block was considered, including the following:

- What age are the buildings?
- What types of buildings are present?
- What function(s) do they serve?
- What architectural styles are apparent?
- How does the structure fit the context of the larger neighborhood?

In light of the neighborhood and block level contexts, analysts selected one or more properties per block to represent the range of buildings over 50 years in age throughout the area. In areas where the project would likely cause more substantial effects, a greater concentration of sample properties was selected. More sample properties were selected for heterogeneous blocks (e.g., blocks having a mix of property types and ages) than homogenous blocks. Where multiple similar buildings exist within the block, analysts selected the building with the greatest integrity or most distinguishing architectural features.

For example, block A contains only residential buildings, both Craftsman style bungalows and Minimal Traditional brick homes. Structures date to the 1920s and 1930s. The project would cause moderate effects on the adjacent block, but block A would be screened from the transit line by an existing row of buildings. Analysts therefore selected one bungalow and one Minimal Traditional house from this block. Alternatively, Block B contains a mix of residential and commercial properties, dating from 1902 through the 1950s, plus some modern infill. A mix of architectural styles is present. In this case, analysts selected five structures on this block to represent the cross-section of existing structures.

This process was repeated along the entire APE corridor.

3.2 Identification of Archaeological Resources

Cultural resource specialists conducted a records search to identify archaeological sites within the vicinity of the project area. The **Illinois State Archaeological Survey** (ISAS) GIS database and supporting documentation provides the most comprehensive source for archival background information on archaeological resources. The ISAS conducts multiple-scale field and laboratory research projects that concentrate on interpreting the archaeological heritage of Illinois. Data sources include the Illinois Department of Transportation Historic Bridge Survey and the Cultural Resource Management Archaeological Report Archive, as well as more detailed supporting information including archeological survey data.

This background research included review of artifacts collected by amateur archaeologists Albert Scharf, Oscar Biedes, and Ed Lace, as well as professional investigations completed by the Illinois State Archaeological Survey.

No known archaeological resources were identified within the project APE.

Section 4
Eligible Historic and Archaeological Resources

4.1 Historic Resources

4.1.1 NRHP-Eligible Resources

Figure 4-1 is a map of the APE and the seven identified NRHP-eligible resources. No properties or districts currently listed on the NRHP are present in the APE. **Table 4-1** summarizes historic resources within the APE. The following subsections provide further details on these historic properties. **Attachment 2** provides inventory sheets for NRHP-eligible properties.

Table 4-1: NRHP-Eligible Resources in the Area of Potential Effects

Figure 4-1: NRHP-Eligible Resources in the Area of Potential Effects

Eclectic Neo-Traditional Home, 444 W. 100th Place

This one-story home in the Washington Heights community area rests on a raised basement as shown in **Figure 4-2**. Built in 1930, it is clad with polychromatic brick and has a side gabled roof covered with asphalt shingles. Its front elevation has a gabled living room bay pavilion with paired basement windows, a group of three non-original one-over-one windows with concrete sills, brick arch lintels, colonettes with acanthus leaf capitals, and a small round-arched window in the gable. The house has a recessed corner porch with a metal storm door, round-arch openings, a Neo-Gothic castellated top, concrete steps, and brick sidewalls. The integrity of its materials and detailing is very good. Its Eclectic Neo-Traditional ornamentation makes it stand out among the vernacular, stripped-down brick and frame bungalows and cottages that comprise the predominant building stock in the Washington Heights community area. As a result, it was identified as individually eligible for NRHP listing under Criterion C for its architecture.

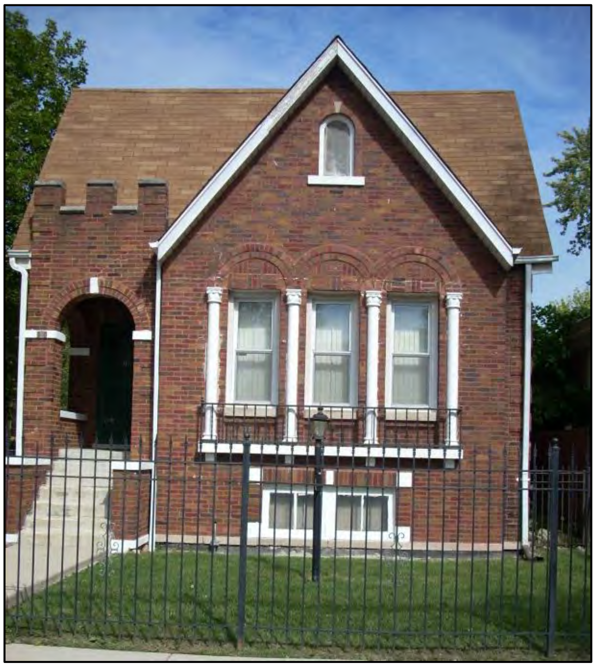

Figure 4-2: South Facade of the Eclectic Neo-Traditional Home at 444 W. 100th Place

Fire Department Engine Company 93, 324 W. 104th Street

This two-story firehouse in the Roseland community area is clad with light brown face brick, as shown in **Figure 4-3**. The building has a flat roof and a parapet with concrete coping. The front elevation has a two-story projecting pavilion, an overhead garage door, two window openings, an off-center, hollow-core metal door on the first floor, and a strip of three windows and a single window on the second floor. All windows are non-original, one-over-one aluminum sash. The spandrel area between the garage door and the windows above features a large stone sign plate inscribed with the words, "City of Chicago Fire Department." The spandrel area between the corner door and window above has a metal plate identifying the 1917 construction date and the names of a series of people associated with the building's construction, including the mayor, alderman, city architect (Charles W. Kallal), and contractor (Butler & Co.). Detailing includes stone door and window surrounds on the first floor, bracketed stone window lintels, concrete belt courses, and brick pilasters topped by stone panels with the City of Chicago's "Y" emblem and decorative scrolls. The "Y" emblem is also repeated above the off-center door.

This building is eligible for individual listing on the NRHP under Criterion C for architecture. It is a rare extant example of an early 20th century neighborhood firehouse in Roseland, has largely retained its original building materials and detailing, and still functions as a firehouse.

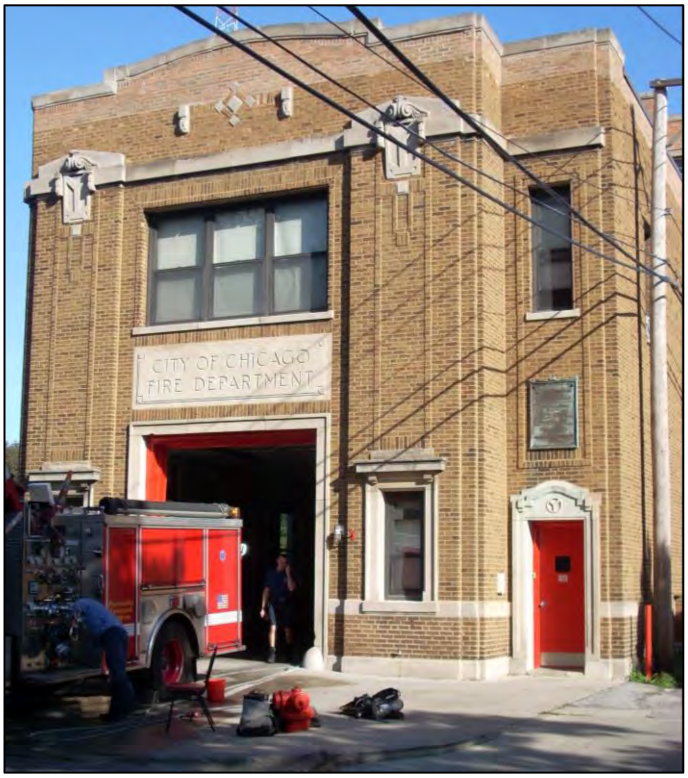

Figure 4-3: South Facade of Chicago Fire Department Engine Company 93

Roseland Pumping Station, 351 W. 104th Street

The two-story Prairie style Roseland Pumping Station, designed by architect William G. Kreig in 1911, is clad in brown brick, as shown in **Figure 4-4**. The building has a high limestone water table, a flat roof, parapet, and two square towers at the corners of the front elevation. The front elevation features a projecting, two-story, flat roofed entrance pavilion with a pair of centrally located glass double doors, sidelights, and a stone panel above that features the City of Chicago's "Y" emblem in metal. The entrance has a smooth stone surround. Above the entrance is a limestone panel incised with the words "City of Chicago Roseland Pumping Station." Detailing on the entrance pavilion includes brick pilasters with stone bases and coping and geometric motifs. The parapet is clad in limestone and features decorative geometric motifs. The building's fenestration is largely composed of multi-paned, steel-sash windows, some of which have transoms.

This is an excellent intact example of a neighborhood pumping station with fine integrity that still functions in its original use. It was identified as individually eligible for the NRHP under Criterion C for architecture, as it stands as an excellent, well-preserved example of a neighborhood pumping station designed in the Prairie style.

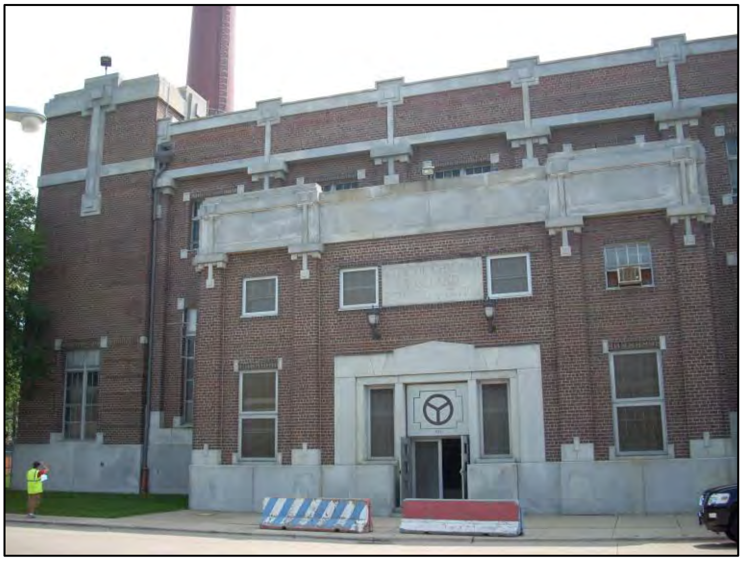

Figure 4-4: North Facade of the City of Chicago Roseland Pumping Station

Romanesque Revival Style Church, 10920 S. Princeton Avenue

This circa 1916 Romanesque Revival style church in the Roseland community area has a front elevation and two flanking towers clad with brown face brick, while the remainder of the side elevation and the rear elevation are clad with common brick. Shown in **Figure 4-5**, the church has a gable roof covered with asphalt shingles and gable wall dormers with shaped parapets on both side elevations. The east tower has a flat roof and a shaped parapet while the west tower has a peaked roof with overhanging eaves and exposed rafters and is topped by a finial. The central bay of the front elevation has a broad, round-arched entrance with a stone surround and two sets of single-light oak double doors. A strip of double-hung windows is within a broad arch and there is a rose window with tracery. Windows on both towers and along the side elevations include round-arch windows with tracery. It is unknown whether the original stained glass for all of these windows is extant inside the church. Both towers also feature paired casement windows. Window openings at the top of the west tower have been boarded over. Detailing includes stone sills, belt courses, brick pilasters, and keystones. A one-story, brick-clad entrance vestibule is along the rear of the west elevation.

Built as the First Reformed Church of Roseland, this church was identified as individually eligible for NRHP listing under Criterion A for its association with the community's once-dominant Dutch population and under Criterion C as a fine example of a Romanesque Revival style church in Roseland.

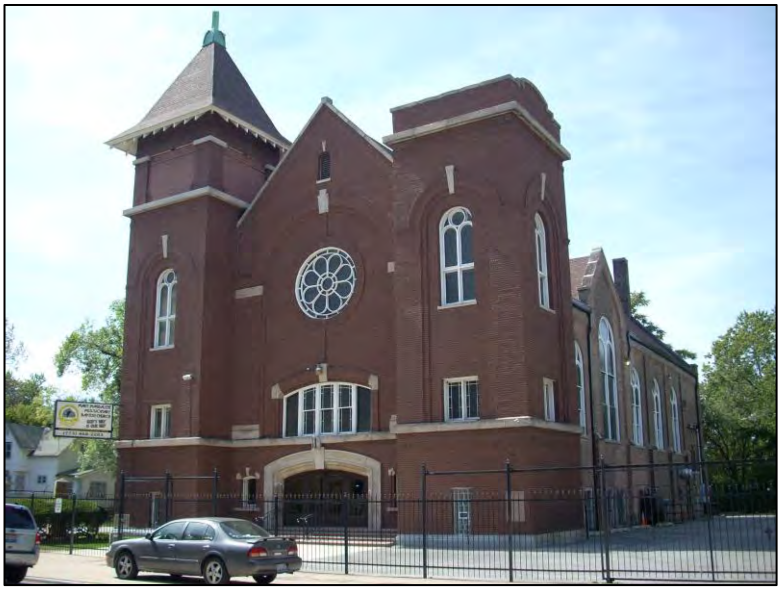

Figure 4-5: East and North Facades of Church at 10920 S. Princeton Avenue

Roseland Community Hospital Nurses Home, 11321 S. Wentworth Avenue

Shown in **Figure 4-6**, this four-story building has a flat roof and parapet. Its symmetrical front elevation is clad with brown face brick and has a centrally located entrance with a glass door and stone surround topped by two stone owls holding books. Windows are non-original one-over-one aluminum sash; those directly above the entrance have stone casings. Detailing includes stone sills, coping, insert blocks, sill courses, cornice, panels, and pinnacles at the parapet level.

This building is locally significant and eligible for NRHP listing under Criterion A for Education. Formerly the Roseland Community Hospital Nurses Home, it was built by the hospital as a dormitory and educational facility for its nurses. Closely affiliated with Roseland Community Hospital, which has served as an important institution in the Roseland area since its establishment in 1924, the Nurses Home is an excellent example of this building type on Chicago's South Side. The exterior of the building has very good integrity and the interior—which now functions as a homeless shelter—appears to retain classrooms and other spaces associated with its original use.

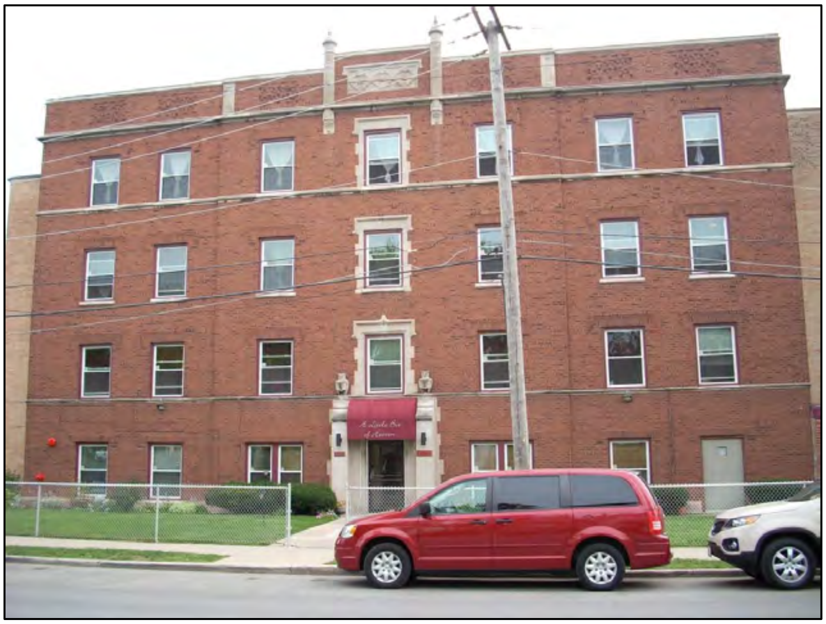

Figure 4-6: Front Facade of Nurses Home at 11321 S. Wentworth Avenue

Venetian Hall, 133–139 E. Kensington Avenue

The two-story performance hall was built for cultural and recreational purposes, although it has long since been repurposed as a church. The 1938 Sanborn map shows the hall with a stage, balcony, and place for storage of scenery. The street entrance was flanked by two storefronts in 1938, as it is today.

Shown in **Figure 4-7**, the 1925 building is clad with face brick on its front elevation and common brick on its side and rear elevations. The building has a flat roof and a shaped parapet with concrete coping. The first floor of the front elevation has a recessed, centrally located bay with three pairs of multi-light wood doors and in-filled transoms. This central bay is flanked by two original storefronts with central recessed doors and flanking display windows that are covered with wood and topped by transoms that have been filled in with glass block. Separating the central bay from the two flanking storefronts and providing access to the second floor are two doors with transoms. The spandrel area directly above the central entrance bay has a concrete sign plate with incised lettering that reads “Venetian Hall.” Fenestration on the second floor features six-over-one and three-over-one wood-sash windows arranged in pairs and in groups of three, topped by round-arch stone lintels with rosette motifs. The parapet features a series of Classical shields and swags.

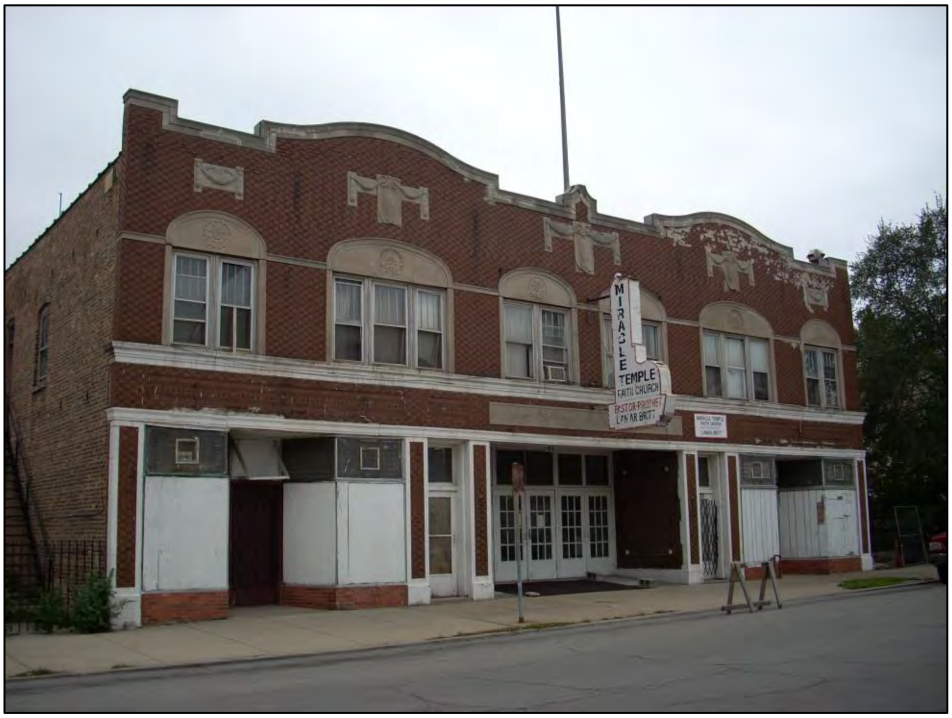

Figure 4-7: Front Facade of Venetian Hall

The exterior of this building has good overall integrity, although elements of the original storefront materials are no longer extant. It does not display sufficient distinguishing architectural features to qualify as individually eligible for listing on the NRHP for its architecture. Instead, it is recommended for individual listing under Criterion A for its original use as a social venue for area residents in the early 20th century. Local theater houses such as the Venetian Hall were jewels within the local communities. It is rare to see an early 20th century neighborhood social hall that retains its original storefronts and is set within a residential area of workers' housing, rather than along a commercial thoroughfare. The opening of Illinois Terra Cotta Works in the first half of the 20th century brought Italians to Kensington; the area gradually became a center of South Side Italian-American life with the establishment of Venetian Hall and the nearby San Antonio de Padua (patron saint of Venice) Roman Catholic Church.

Altgeld Gardens Historic District

This large public housing project was built between 1943–1945 and is shown in **Figure 4-8**. Designed by architects Naess & Murphy, it was originally comprised of 1,498 units located on over 190 acres. Altgeld Gardens is mainly comprised of two-story buildings that are topped with side gable roofs covered in asphalt shingles. The buildings are clad in brick with stepped parapet walls along the gable elevations. A series of single entry doors are located on the front facade. A combination of original and replacement windows are found throughout the complex. Groups of seven units are clustered around central courtyards.

This resource was determined eligible as a district in 1992 by IHPA under Criterion A for its association with community development, planning, and social history.

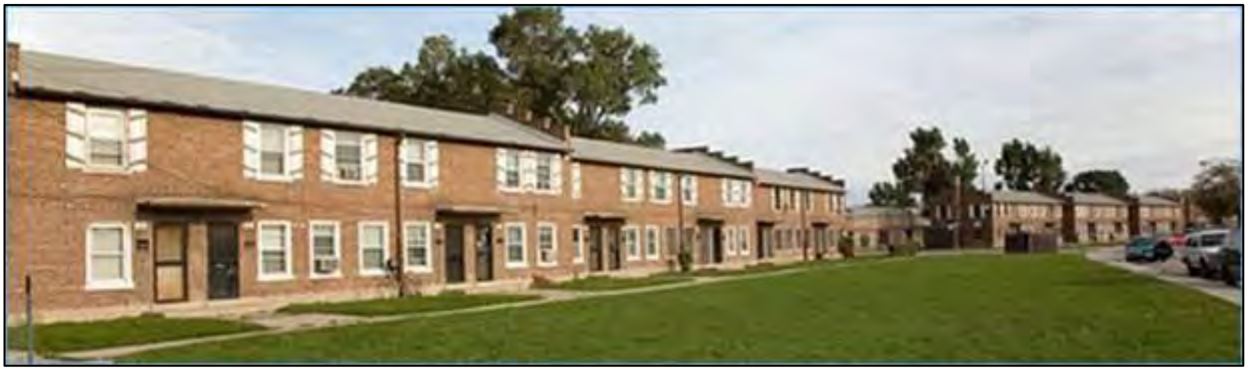

Figure 4-8: Photo of Altgeld Gardens

4.1.2 CHRS Orange-Rated Properties

Beyond the NRHP-eligible resources, four properties within the APE are identified as notable "Orange" in the CHRS, three of which have also been identified as NRHP-eligible:

- Fire Department Engine Company 93 at 324 W. 104th Street (NRHP-eligible, ID #3)
- Roseland Pumping Station at 351 W. 104th Street (NRHP-eligible, ID #4)
- Romanesque Revival-style church at 10920 S. Princeton Avenue (NRHP-eligible, ID #5)
- St. Salomea Church at 11800–11808 S. Indiana Avenue

These CHRS "Orange"-rated resources are protected by the City's 2003 Demolition-Delay Ordinance. As none of the CHRS "Orange"-rated resources are proposed for demolition under either the East or West Option, this ordinance is not discussed further.

4.2 Archaeological Resources

A records search was conducted by cultural resource specialists and no known archaeological sites exist within the APE. Although the landscape through which the transit lines would pass is developed, additional archaeological sites may remain undiscovered within protected locations such as parks and gardens. Once the project design has been further refined and before the Final EIS is published, archaeological investigations will occur within areas of ground disturbance for the selected option to determine whether potential resources are present. These investigations will follow the guidelines issued by the State of Illinois.

Section 5
Effects Determinations and Mitigation

5.1 Effect Analysis Thresholds

The NHPA establishes qualitative criteria that define whether a historic property would be subject to an adverse effect: when a project “may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association” (36 CFR 800.5.a). Based on this regulatory framework, an adverse effect finding will be applied to any historic property that would be subject to one or more of the following (36 CFR 800.5.a.2):

- Physical destruction or damage to all or part of the archaeological resource or historic property
- Alteration that is inconsistent with the Secretary of the Interior's *Standards for the Treatment of Historic Properties*
- Removal of the property from its historic location
- Introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant features
- Change to the character of the property's use or the physical features within the property's setting that contribute to its significance
- Neglect of a property that causes deterioration
- Transfer, lease, or sale of property out of federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation

Effects can be direct, indirect, or cumulative. If an adverse effect is found, the Federal Transit Administration (FTA) would consult with the Illinois Historic Preservation Agency (the SHPO for Illinois) and other interested parties to develop and evaluate alternatives or modifications to the undertaking that could avoid, minimize, or mitigate adverse effects on the resource (36 CFR 800.6.a).

Effects determinations from the No Build and Build Alternative are provided below.

5.2 No Build Alternative

No adverse effects on historic and cultural resources would result from implementation of the No Build Alternative; therefore, no mitigation measures would be required.

5.3 Build Alternative – UPRR Alternative

Table 5-1 summarizes the effects findings for each historic resource in the APE for both the East and West Options.

Table 5-1: NRHP-Eligible Resources in the Area of Potential Effects - Union Pacific Railroad Alternative East and West Options

ID	Description	Union Pacific Railroad Alternative East Option Effects Finding	Union Pacific Railroad Alternative West Option Effects Finding
1	Eclectic Neo-Traditional Home	No Historic Properties Affected	No Historic Properties Affected
2	Fire Department Engine Company 93	No Historic Properties Affected	No Historic Properties Affected
3	Roseland Pumping Station	No Adverse Effect	No Historic Properties Affected
4	Romanesque Revival-Style Church	No Historic Properties Affected	No Historic Properties Affected

6	Former Venetian Hall	No Historic Properties Affected	No Historic Properties Affected
7	Altgeld Gardens Historic District	No Historic Properties Affected	No Historic Properties Affected

NRHP = National Register of Historic Places

5.3.1 East Option

The East Option would cause displacements and visual, noise, and other environmental effects within the APE, but none of these effects would alter the characteristics that qualify any of the identified historic resources for inclusion on the NRHP. No mitigation measures would be required. Because none of the NRHP-eligible resources in the APE would be directly affected (they would not be displaced), each resource was evaluated for potential visual effects from the aerial structure, stations, and parking facilities.

Figure 5-1 is a photo simulation of the East Option track structure adjacent to the Roseland Pumping Station. Although the track structure would be approximately 9 feet west of the Roseland Pumping Station at its nearest point, the East Option is anticipated to have no adverse effect. The pumping station would not be displaced or directly affected by the UPRR Alternative. The resource was recommended eligible under Criterion C for its architecture as an excellent example of a well-preserved community pumping station designed in the Prairie Style that still functions in its original use. The building retains much of its original design, materials, and workmanship, including its projecting two-story flat-roofed entrance pavilion with geometric limestone details and coping. The proposed project would not affect these characteristics and would preserve the property’s entrance approach. The changes in setting and feeling brought on by the proposed project would not detract from the architectural aspects of the building that qualify the resource as eligible for NRHP listing. Pile-driving activities would be avoided in the vicinity of the pumping station.

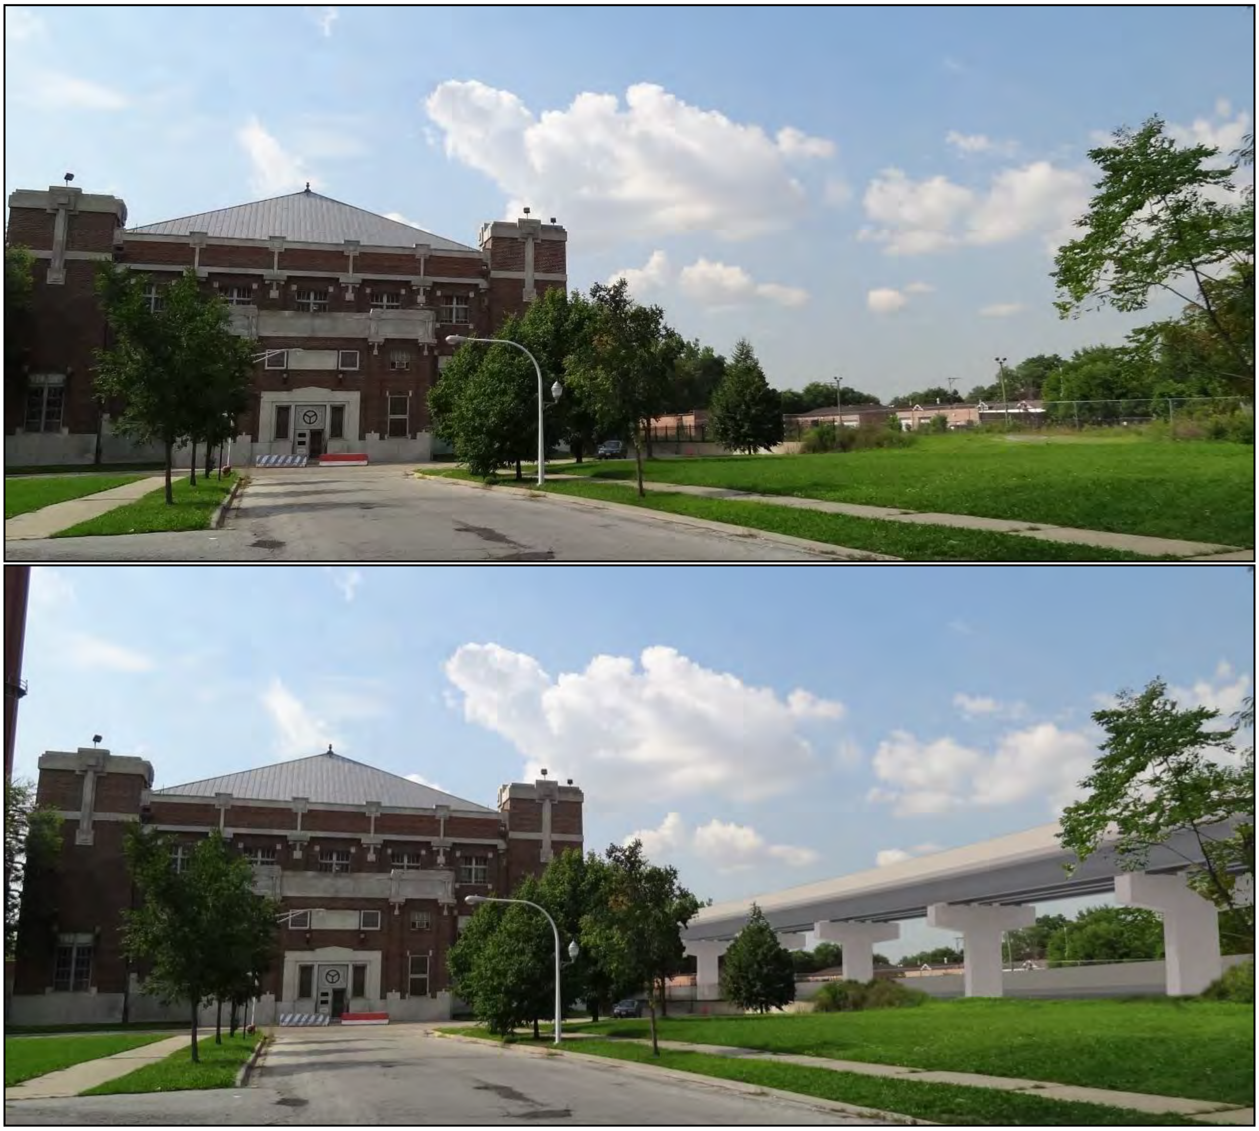

Figure 5-1: Photo of Existing Conditions and Photo Simulation of the Union Pacific Railroad Alternative East Option Elevated Track Structure adjacent to the Roseland Pumping Station, Facing South on Harvard Avenue

The 130th Street station would be approximately 800 feet from Altgeld Gardens Historic District at its closest point and the parking garage at the 130th Street station would be located at a distance away from Altgeld Gardens where the size of the structure would not create a visual impact; therefore, the 130th Street station and parking garage would not affect the Altgeld Gardens Historic District. **Figure 5-2** shows a view of the 130th Street station and parking structure from Altgeld Gardens.

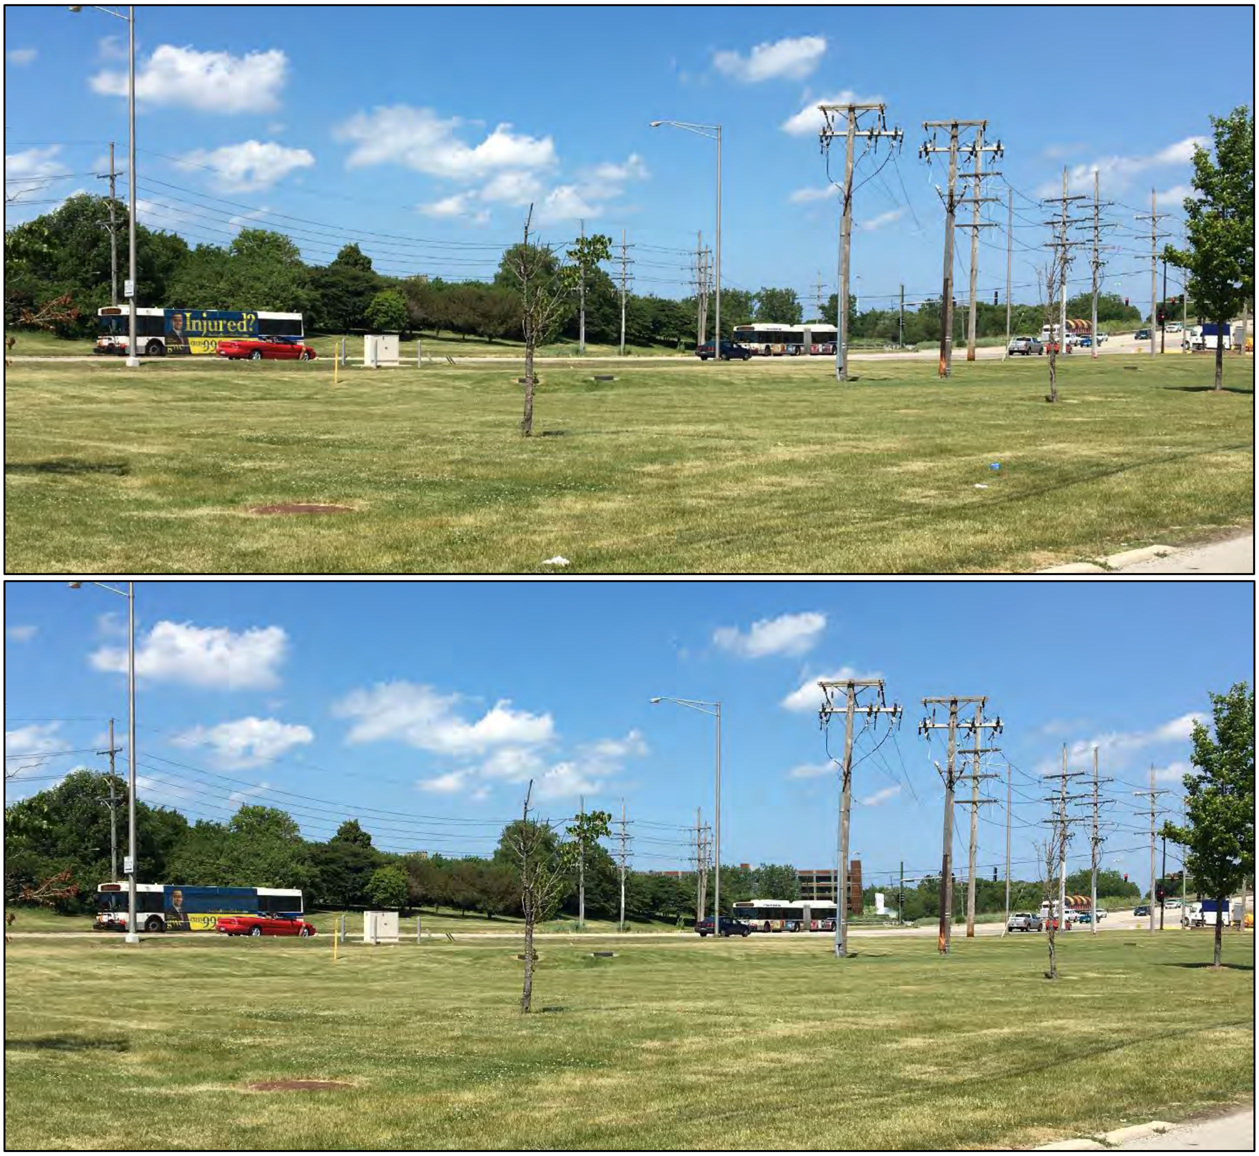

Figure 5-2: Photo of Existing Conditions and Photo Simulation of the 130th Street Station and Parking Garage, Facing Northeast on 130th Place

5.3.2 West Option

Like the East Option, the West Option would cause displacements and visual, noise, and other environmental effects within the APE, but none of these effects would alter the characteristics that qualify any of the identified historic resources for inclusion on the NRHP. No mitigation measures would be required.

Section 6
Consultation Process

In accordance with requirements for consultation established in Section 106 of the NHPA, three distinct rounds of coordination occurred during the RLE Project: initiation activities, identification of historic properties, and assessment of effects. Because there would be no adverse effects as a result of this project, no additional coordination for resolution of adverse effects was needed. Each outreach effort is described in the following sections. **Attachment 3** contains copies of meeting notes from each of these meetings, comments received from consulting parties, and responses to comments.

6.1 Initiation Activities

6.1.1 Invitations to Participate

In August 2012, FTA sent invitation letters to 11 Native American tribes to inform them of the process and request assistance in identifying areas with potential cultural and/or religious significance. Also in August 2012, CTA sent invitation letters to 19 state and local preservation interest groups to inform them of the project and invite them to participate in the upcoming consultation process. FTA and CTA sent invitation letters to the following recipients:

Native American Tribes

- Ho-Chunk Nation
- Miami Tribe of Oklahoma
- Peoria Tribe of Indians of Oklahoma
- Sac and Fox Nation of Oklahoma
- Pokagon Band of Potawatomi Indians
- Prairie Band of the Potawatomi Nation
- Citizen Potawatomi Nation
- Forest County Potawatomi Nation
- Potawatomi Nation
- Sac and Fox Nation of Mississippi in Iowa
- Sac and Fox Nation of Missouri

State and Local Preservation Groups

- SHPO
- Advisory Council on Historic Preservation
- Illinois State Museum
- Illinois State Archaeological Survey
- City of Chicago Department of Planning and Development's Historic Preservation Division
- Preservation Chicago
- Landmarks Illinois
- Chicago Historical Society
- Ridge Historical Society
- Beverly Area Planning Association
- East Beverly Association
- Rosemoor Community Association
- Cottage Grove Cottage Grove Heights Community Coalition
- Historic Pullman Foundation
- South Suburban Genealogical and Historical Society
- Chicago Neighborhood Initiatives
- Neighborhood Housing Services of Chicago
- Mercy Housing Lakefront
- Friends of the Parks

At present, 11 groups are participating in the process. The consulting parties include the SHPO, the City of Chicago Department of Planning and Development's Historic Preservation Division, Preservation Chicago, Landmarks Illinois, the Ridge Historical Society, the Rosemoor Community Association, Friends of the Parks, Chicago Neighborhood Initiatives, Neighborhood Housing Services of Chicago, DCP, and the Chicago Park District.

6.1.2 Section 106 Kickoff Webinar

On October 24, 2012, FTA and CTA held a webinar on RLE historic properties to introduce the project and initiate the consultation process. During the eligibility phase of consultation, properties and districts that were identified as eligible for listing on the NRHP were discussed. Properties over 50 years old in the APE were evaluated to determine whether they are NRHP-eligible under one of the four National Park Service Criteria for Evaluation.

6.2 Identification of Historic Properties

FTA and CTA provided draft materials on the identification of NRHP-eligible properties to consulting parties on January 4, 2013, in compliance with Section 106 of the NHPA. A 30-day comment period followed, with an in-person meeting on January 30, 2013 to facilitate discussion among consulting parties. The meeting was followed by an informal tour of the corridor that afternoon. As part of this phase of coordination, CTA received written comments from six consulting parties.

Comments received from consulting parties in regards to eligibility focused on requesting additional surveys of resources, potential districts that should be considered recommended as eligible, reconsideration of surveyed properties and their eligibility, and the importance of looking at resources in the historical/social context.

As part of the eligibility phase, CTA surveyed 541 potentially eligible resources within the APEs for all alternatives being studied at the time (BRT, UPRR, and Halsted Alternatives). As a result of the field investigations and comments received from consulting parties on potentially eligible resources, for all alternatives, 15 total resources were identified as eligible for inclusion on the NRHP, including 13 individual buildings and 2 historic districts.

Specifically for the UPRR Alternative, CTA surveyed 280 potentially eligible resources within the UPRR Alternative APE. As a result of the field investigations and comments received from consulting parties on potentially eligible resources, for the UPRR Alternative, 7 total resources were identified as eligible for inclusion on the NRHP, including 6 individual buildings and 1 historic district.

6.3 Assessment of Effects

FTA and CTA mailed a Draft Effects Report to consulting parties on April 18, 2014, requesting any written comments by May 23, 2014. On May 8, 2014, FTA and CTA met with consulting parties to discuss potential project effects on NRHP-eligible historic properties. CTA received written comments from four consulting parties.

Comments received from consulting parties in regards to assessments of effect included eligibility reconsiderations, effects reconsiderations, and requests for renderings for properties in the APE. Comments also related to effects associated with the Halsted Alternative and 130th Street West Station Option, both of which have been eliminated from further consideration.

As discussed above in Section 2, in August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Alternative. Additional conceptual engineering was conducted on the UPRR Alternative to refine the East and West Option alignments. In addition, CTA is now considering only the South Station Option of the 130th Street Station. Further details on the alternatives evaluated and eliminated through the Draft EIS process are provided in **Attachment 1**.

CTA provided responses to all consulting party comments received in May 2014 on November 23, 2014. Responses noted that the alternatives had been further narrowed and that the UPRR Alternative (East and West Options) were proposed to move forward as the NEPA Preferred Alternative. The consulting parties requested renderings at the Roseland Pumping Station and the 130th Street station near Altgeld Gardens, which are included in the Draft EIS.

6.4 Resolution of Adverse Effects

Based on the assessment of effects and review of consulting party comments, CTA recommends that no adverse effects on historic resources would occur because of the RLE Project (East or West

Option); no mitigation measures would be required and therefore consultation with consulting parties is complete. Coordination with the SHPO will continue through the remainder of the project.

Attachment 3: Section 106 Consultation Supporting Documentation

Attachment 1
Alternatives Development Process

CTA began developing the alternatives studied in the Draft EIS during the Alternatives Analysis (AA), which took place during 2006–2009. Starting with multiple modes and corridor options, CTA developed and screened alternatives through a combination of conceptual engineering, public input (open house and stakeholder meetings), and preliminary analysis of potential impacts and costs. A three-level, detailed screening process was used to evaluate the alternatives and identify an LPA. The LPA Report provides detailed documentation of the Screen 1, Screen 2, and Screen 3 evaluations.

The Screen 1 evaluation began by identifying the universe of alternatives, which included a wide range of transit modes (such as bus, rail, or streetcar), project area corridors, and profiles (where the transit line is in relation to the ground). Combinations of 11 modes, 9 corridors, and 4 profiles were evaluated against the purpose and need. Based on this evaluation, the following alternatives were carried forward for further analysis in Screen 2: two bus rapid transit (BRT) alternatives along Halsted Street and Michigan Avenue; six heavy rail transit (HRT) alternatives along Halsted Street, the Union Pacific Railroad (UPRR), and Michigan Avenue; the No Build Alternative; and a “low cost” alternative (formerly required for FTA analyses known as the Transportation System Management [TSM] Alternative).

The alternatives carried through to the Screen 2 evaluation were more thoroughly defined to include mapping of a more defined alignment, identification of potential station locations, and preliminary service plans. Station spacing was determined by the type of alternative proposed, project area needs, and consistency with the purpose and need. The eight evaluation factors for the Screen 2 included a mix of qualitative and quantitative factors intended to further evaluate the performance of each alternative with respect to the project goals and objectives. Specific evaluation factors included physical constraints; right-of-way requirements; social and economic factors; demographics and employment; environmental factors; noise, visual, natural, and cultural resource impacts; transportation factors; and travel time, transit connectivity, and traffic.

Based on the results of the Screen 2 evaluation, a BRT alternative along Halsted Street (operating on dedicated lanes), two HRT alternatives along Halsted Street and the UPRR, the No Build Alternative, and the TSM Alternative were recommended for further evaluation in Screen 3. In addition to the alternatives carried forward from the Screen 2 evaluation and based on discussions with FTA, CTA combined the TSM Alternative with a BRT alternative (operating on existing right-of-way rather than dedicated lanes as proposed in Screen 2) along Michigan Avenue to form a single alternative (called the BRT Alternative) for evaluation in Screen 3. Because the Michigan Avenue BRT Alternative would operate in the existing right-of-way, it would require fewer property acquisitions than BRT on dedicated lanes. Screen 3 was a two-step evaluation process that included the further definition and refinement of alternatives, including conceptual design and the evaluation of these alternatives. Nine evaluation factors were used to evaluate the alternatives as part of Screen 3, including physical constraints, public support, social and economic factors, environmental factors, transportation factors, capital cost comparison, operating and maintenance cost comparison, ridership potential, and FTA's Cost Effectiveness Index. The result of the Screen 3 evaluation was a recommendation for the LPA: the UPRR Alternative.

Based on the results of the AA and considerable public support for the corridor, including a 2004 referendum where 38,000 residents in the 9th and 34th Wards supported the UPRR corridor for the RLE Project, the UPRR Alternative was recommended as the LPA, indicating that it is the alternative that would best meet the purpose and need of the project while addressing potential impacts and other potential constraints. The UPRR Alternative would provide access to the most densely populated portions of the study area, which are primarily residential and transit supportive. The Chicago Transit Board designated the UPRR Alternative as the LPA on August 12, 2009. **Figure 1** summarizes the AA process.

[1] The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative on August 12, 2009.

[2] This Draft EIS presents impacts of the No Build Alternative and two options of the UPRR Rail Alternative: the East Option and the West Option.

EIS = Environmental Impact Statement, UPRR = Union Pacific Railroad

Figure 1: Alternatives Development Summary

After the AA, CTA further refined the alternatives for presentation during the NEPA scoping process and study in the Draft EIS. At the conclusion of the AA process, the UPRR Alternative was anticipated to be located adjacent to the east or west edge of the UPRR right-of-way. In 2012, CTA learned of a Chicago Department of Transportation (CDOT) feasibility study looking at moving UPRR freight operations out of the existing UPRR corridor before the RLE Project. By moving UPRR freight operations out of the existing UPRR corridor, CTA could use the existing UPRR right-of-way for the RLE Project. CTA evaluated this new option of the UPRR Alternative, known as the Right-of-Way Option, in preparation of the Draft EIS. Subsequent coordination between local agencies and the railroads indicated that relocating UPRR freight operations from this corridor presents considerable challenges and would not be feasible.

During 2012–2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the BRT Alternative (along Michigan Avenue), the UPRR Alternative, and the Halsted Alternative. CTA evaluated three options for the UPRR Alternative: the Right-of-Way Option, East Option, and West Option. CTA also evaluated two options for the UPRR Alternative 130th Street station: a South Station Option and a West Station Option.

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Alternative. Because the Right-of-Way Option is not feasible, the Draft EIS evaluates only the East and West Options for the UPRR Alternative. CTA has chosen to move forward with the South Station Option at 130th Street based on technical analysis and public feedback. Additional information about the BRT Alternative, UPRR Right-of-Way Option, UPRR West Station Option for the 130th Street station, and Halsted Alternative is presented below in the discussion of alternatives considered but not pursued.

Alternatives Considered but Not Pursued

During development of the project, CTA fully evaluated the BRT Alternative, the Right-of-Way Option for the UPRR Alternative, and the Halsted Rail Alternative (Halsted Alternative). In addition, CTA fully evaluated a West Station Option for the 130th Street station. These alternatives and the station option were analyzed as part of the technical memoranda preparation for the Draft EIS, but are not included in the Draft EIS. They were eliminated from analysis based on public input, technical constraints, potential impacts, and the extent to which they met the project's purpose and need.

CTA also evaluated a variation of the UPRR Alternative where the tracks would be at grade rather than elevated, described below.

Bus Rapid Transit Alternative

CTA considered a BRT Alternative along Michigan Avenue between 95th Street Terminal and Altgeld Gardens. This limited-stop enhanced bus route along the existing #34 South Michigan Avenue bus route would have transit signal priority along Michigan Avenue. The alternative included four stops, each with park & ride facilities. Although the BRT Alternative was a lower-cost alternative than the UPRR Alternative, it was eliminated in August 2014 based on public feedback including the following concerns:

- The BRT Alternative would have minimal travel time improvements compared to the No Build Alternative (23 minutes from 130th Street to 95th Street under the BRT Alternative, compared to 28 minutes for existing conditions or 14 minutes for the UPRR Alternative over the same distance).
- Approximately 1 million riders per year were anticipated for the BRT Alternative (in comparison to 13 million riders per year anticipated for the UPRR Alternative).
- The BRT buses would not have traveled on a dedicated lane along Michigan Avenue because of limited right-of-way. Although transit signal priority was planned, additional travel time savings would not have been realized without dedicated lanes for BRT buses.

Union Pacific Railroad Alternative

The Draft EIS summarizes the benefits and impacts of the East and West Options. In preparation of the Draft EIS, CTA fully evaluated the Right-of-Way Option and the 130th Street Station West Station Option. CTA also considered an at-grade (rather than elevated) track structure for the UPRR Alternative.

Right-of-Way Option

As part of the UPRR Right-of-Way Option, the elevated CTA structure would have been placed in the UPRR right-of-way. This option was added in 2012 in response to the CDOT feasibility study looking at moving UPRR freight operations out of the existing UPRR corridor before the RLE Project. The Right-of-Way Option would only be feasible if the separate project were implemented before implementation of the RLE Project. Coordination between local agencies and the railroads indicted that relocation of UPRR freight operations from this corridor presents considerable challenges; therefore, this option is no longer feasible. Estimated travel times and ridership were the same for the Right-of-Way Option as for the East and West Options. Because the elevated CTA structure would have been placed in the UPRR right-of-way, the Right-of-Way Option would have resulted in fewer displaced properties than either the East or West Option.

130th Street Station - West Station Option

CTA initially considered two options for the 130th Street station: a South Station Option and a West Station Option. The South Station Option would be located immediately west of the

Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad (NICTD/CSS & SBRR) right-of-way at 130th Street. The West Station Option would be located along the north side of 130th Street at Evans Avenue. Pedestrians from Altgeld Gardens would access the West Station Option through a pedestrian crosswalk on 130th Street. A traffic signal would be required at this intersection to allow pedestrians to safely cross 130th Street.

The South Station Option is supported by the community and the Chicago Housing Authority because it would be more accessible from Altgeld Gardens. The West Station Option would incur additional costs because it would require approximately 1,100 feet of additional track due to its location, and would require intersection improvements to allow pedestrians to safely cross the street. The South Station Option would provide the best opportunity for a future connection to NICTD, improving regional rail connections and linkages to other modes of public transportation. Based on public feedback and technical analysis, CTA is considering only the South Station Option for 130th Street station.

At-Grade Track Structure

CTA considered a variation of the UPRR Alternative in which the RLE tracks would run at grade along the UPRR rail corridor (between I-57 and Prairie Avenue). In this variation, the existing east-west roadways would run either above or below the new at-grade CTA tracks and the existing at-grade UPRR tracks. Like the proposed UPRR Alternative, this variation would be elevated from the 95th Street Terminal to south of I-57, then at grade from I-57 to Prairie Avenue, elevated to cross the Canadian National/Metra Electric District (CN/ME) tracks near 119th Street, then at grade near the proposed yard and shop and 130th Street station. CTA evaluated potential impacts and cost implications to run the east-west roadways both above (using overpasses) and below (using underpasses) the at-grade UPRR tracks and the proposed at-grade CTA tracks.

Roadway Overpasses

For an at-grade track structure, one option would be to use overpasses to carry roadways over the tracks. If roadway overpasses were used, they would need to be constructed at eight locations. More than 100 properties (primarily residential homes) would be displaced due to the overpass footprint, elimination of access to existing alleyways or driveways, and proximity of the embankment structure to the residential homes. The overpass structure and associated embankment could be as high as 30 feet, creating a substantial visual impact on the adjacent one-story residential buildings. In addition, permanent north-south residential street closures would be required where the streets would intersect with the embankment, which would disrupt neighborhood connectivity. Utilities that currently run within the street rights-of-way would have to be relocated. The potential construction cost savings between the elevated track structure and the at-grade structure would be insignificant when the cost of additional right-of-way acquisition and utility relocations is included. Roadway overpasses would also increase community impacts.

Roadway Underpasses

A second option for an at-grade track structure would be to use underpasses to carry roadways under the tracks. If underpasses were used, they would need to be constructed at eight locations. The underpass variation would have property displacements and community impacts similar to those of the roadway overpass option except a large retaining wall would be located in front of the residential homes. Because the cost of a roadway underpass structure may be as much as double the cost of an overpass structure, this variation would provide no additional cost savings over the elevated track structure alternative and would have significantly more community impacts and right-of-way costs.

Based on the property displacements and community impacts that would be created by grade-separating the roadways from the proposed CTA tracks (through either roadway overpasses or underpasses), CTA eliminated this variation from further consideration.

Halsted Alternative

CTA considered the Halsted Alternative, which would extend the Red Line from 95th Street Terminal along I-57, and south along Halsted Avenue to Vermont Avenue on a new elevated structure. The Halsted Alternative would run above Halsted Avenue with center piers, except at the station locations where the structures would span Halsted Avenue. The Halsted Alternative would result in travel times similar to those of the UPRR Alternative. The alternative included four stations, each with park & ride facilities. Construction costs for the Halsted Alternative were approximately 6 percent higher than for the UPRR Alternative. The Halsted Alternative was eliminated in August 2014 based on technical analysis and public feedback including the following concerns:

- The Halsted Alternative would not have the potential for a direct connection to other regional transit services[2] like the UPRR Alternative would; therefore, it would not meet the purpose and need for the project.
- The Halsted Alternative would affect four historic resources, resulting in adverse effects on historic properties, while the UPRR Alternative would not affect any historic resources.
- The proposed seven-story parking structure at Vermont Avenue would result in adverse visual impacts because of its location within a neighborhood with single-family homes.
- The Halsted Alternative would not directly serve as many affordable housing locations in the project area as the UPRR Alternative would serve, including Altgeld Gardens.
- The public expressed concern that implementation of the Halsted Alternative would be disruptive to the surrounding community and would increase shadows, crime, and noise along the Halsted Street.

---

[2] Although the Halsted Alternative intersects the ME Blue Island branch, the southern terminus of that branch is less than 3 miles from the intersection at Halsted Street and is located just to the west of the project area. The northern terminus of the ME Blue Island branch is only two blocks from the Red Line in the Loop. Intersection with the ME Blue Island branch would not provide regional service.

- The Halsted Alternative did not receive the considerable public support before and during scoping in 2009 that the UPRR Alternative received.

Property Description: **Stories:** 1

This one-story brick bungalow in the Washington Heights community is clad with tan face brick on its front elevation, common brick on its side elevations, and synthetic siding on its rear elevation. It has a steeply pitched hip roof covered with asphalt shingles and synthetic-clad, hip roof dormers with paired one-over-one windows on both the front and rear elevations. The front elevation has a recessed corner porch with round-arch opening, low brick sidewalls, and concrete steps. The residence also includes a door tucked into the side of the living room bay and four one-over-one windows, three of which are grouped together under a segmental arch. All windows are modern replacements with aluminum sashes. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised brick basement with glass block windows, is clad with buff brick, and has a hip roof covered with asphalt shingles and overhanging eaves. Its front elevation is fronted by a faux stone planter. It has an off-center door and sidelight comprised of glass blocks, two decorative glass block inserts, a picture window flanked by one-over-one aluminum-sash windows, and concrete steps behind a low faux stone wall. An attached two-car hip roof garage clad in the same buff brick is situated along the home's rear elevation. It does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

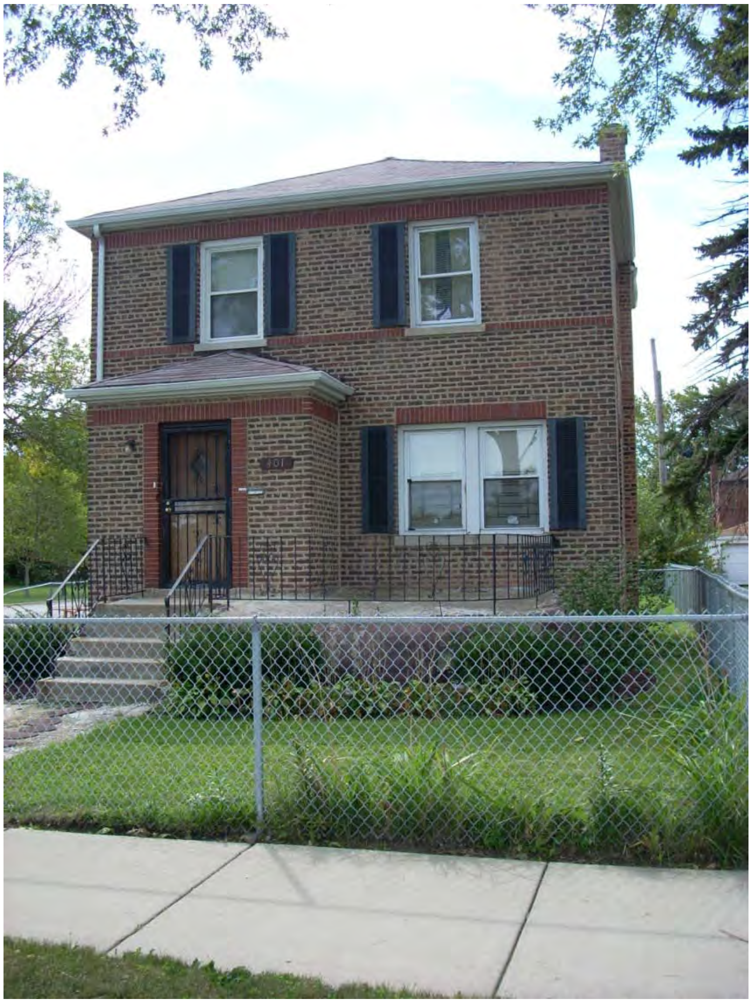
North façade of a brick, two-story, single family residence



Property Description: **Stories:** 2

This two-story, brick clad house in the Washington Heights community is situated on a raised brick basement with glass block windows. The house has a hip roof covered with asphalt shingles. Its front elevation has a partial-width, hip roof, brick clad, enclosed porch with a metal storm door. It has concrete steps, metal railings, a pair of windows on the first floor and two single windows on the second floor. Windows throughout the house are non-original one-over-one aluminum-sash. Detailing includes concrete sills and orange brick banding that contrasts with the brown face brick cladding. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story house in the Washington Heights community is clad with polychromatic brick and has a side-gabled roof covered with asphalt shingles. End gable walls are clad in aluminum siding. Its front elevation features a gabled pavilion with a strip of three non-original one-over-one aluminum-sash windows and a gabled entrance vestibule featuring a wood door with diamond pane window, concrete steps, and metal railings. A single non-original one-over-one aluminum-sash window is located in the corner of the front elevation. A small ventilating louver is situated in the gable. Detailing includes concrete sills and lintels with keystones. This house does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

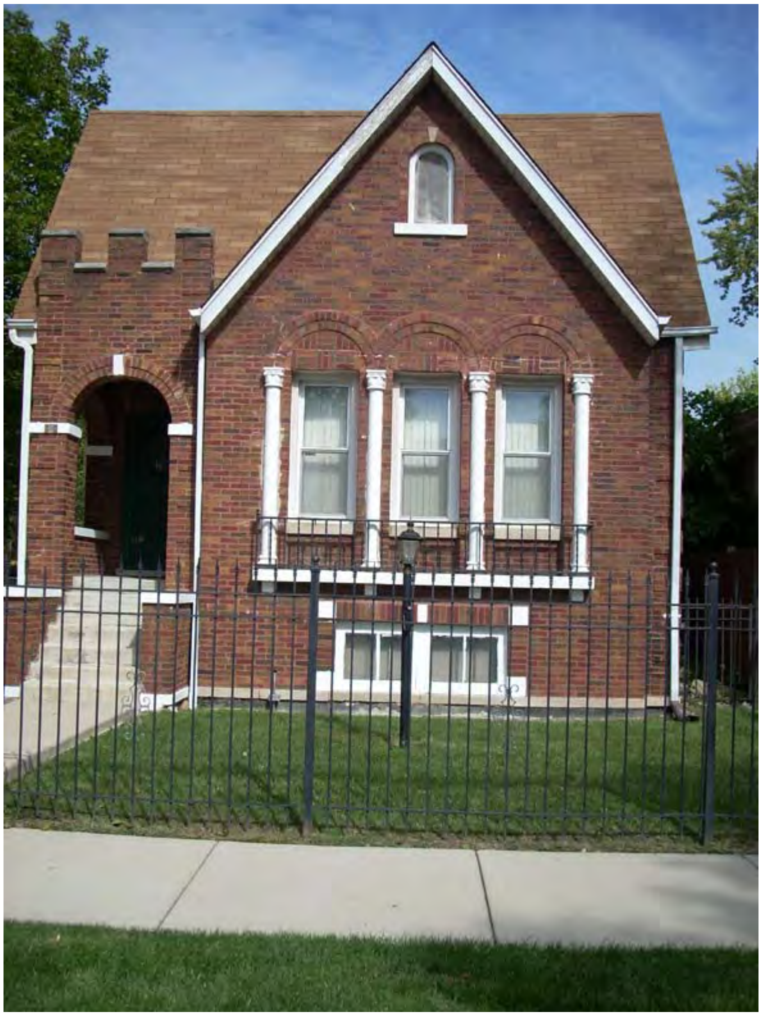
South façade of a brick one-story, brick, single family residence.



Property Description: **Stories:** 1

This one-story house in the Washington Heights community sits on a raised basement. It is clad with polychromatic brick and has a side gabled roof covered with asphalt shingles. Its front elevation has a gabled living room bay pavilion with paired basement windows that appear to be casements. There is a group of three non-original one-over-one windows with concrete sills and brick arch lintels that are separated by colonettes with acanthus leaf capitals. A small round-arched window is located in the gable. The house has a recessed corner porch with a metal storm door, round-arch openings, a Neo-Gothic castellated top, concrete steps, and brick sidewalls. This house has very good integrity in terms of its materials and detailing, and its Eclectic Neo-Traditional ornamentation makes it stand out among the vernacular, stripped-down brick and frame bungalows and cottages that comprise the predominant building stock in the Washington Heights community. As a result, it is recommended as individually eligible for National Register listing under Criterion C for architecture.

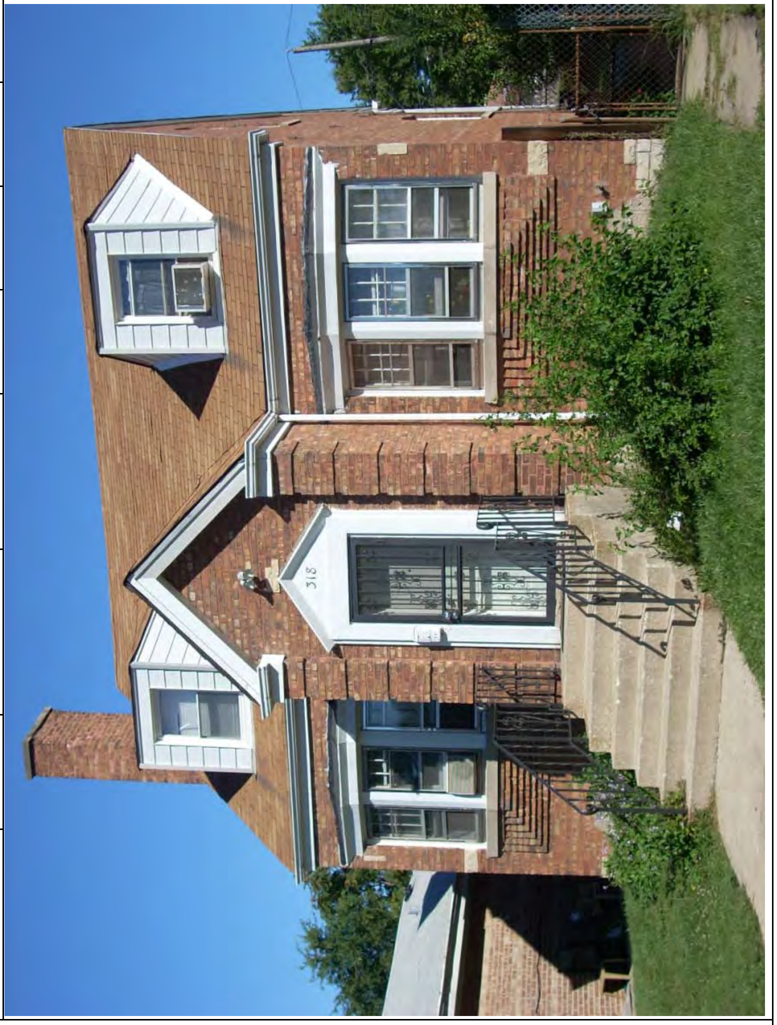
North façade of 1.5-story, brick, single family residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story brick-clad home has a steeply pitched side gable roof covered with asphalt shingles, an exterior brick chimney, and two aluminum-clad shed dormers, each of which has a single one-over-one aluminum-sash window (non-original). Its front elevation has a centrally located gabled front vestibule with brick quoins, a door with wood surround and pediment, and concrete steps with metal railings. The entrance is flanked by three-sided window bays, which feature six-over-one windows with decorative brick corbelling beneath. It does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

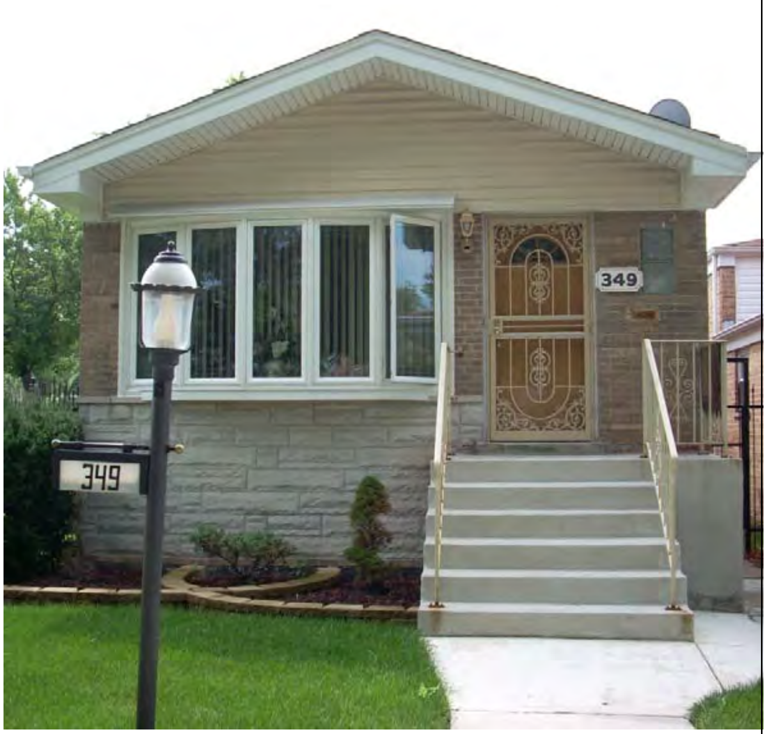
North façade of brick, single family residence.



Property Description: **Stories:** 1

This one-story home in the Roseland community is clad in brown face brick and common brick along its front and side elevations, respectively. It has a hip roof covered with asphalt shingles. Its front elevation has an off-center door and a porch with concrete steps, metal railings, open metal supports, and metal awning roof. The front façade features a strip of three non-original one-over-one windows with concrete sills and a gable dormer with two single-pane windows. Glass block windows provide light in the basement. This building lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

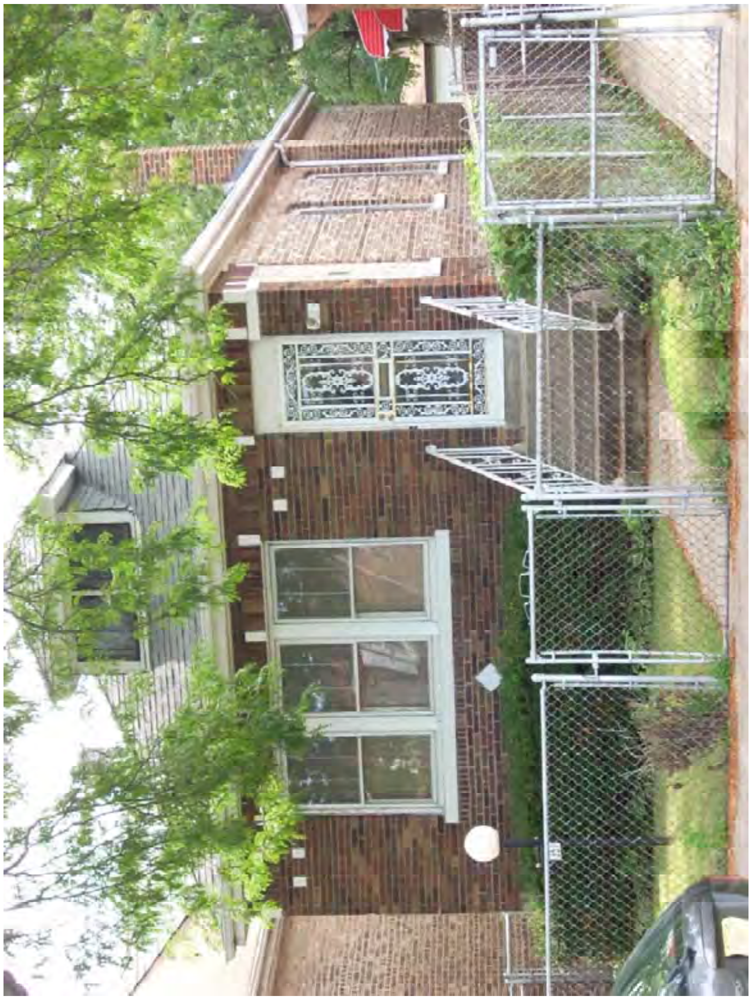
North and west façades of a one-story, brick single family residence.



Property Description: **Stories:** 1

This one-story house is situated on a raised basement. It has a rectangular footprint, a hip roof covered with asphalt shingles, and a hip roof dormer with paired windows. Its front façade is clad in brown face brick with concrete block inserts and has a strip of three three-over-one windows. Its off-center metal core door is accessed via a short flight of concrete steps with metal railings. The side elevations are clad in common brick. This home does not have distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story house is situated on a raised basement. It has a rectangular footprint, a hip roof covered with asphalt shingles, and overhanging eaves. Its front façade is clad in buff face brick and has a strip of three windows, which appears to be one large picture window flanked by double-hung windows, beneath a metal awing. The off-center metal core front door is accessed via a flight of concrete steps with metal railings. Two large decorative glass blocks are situated next to the door. The side elevations are clad in common brick. This home does not have distinguishing architectural features and is not individually eligible for listing on the National Register.

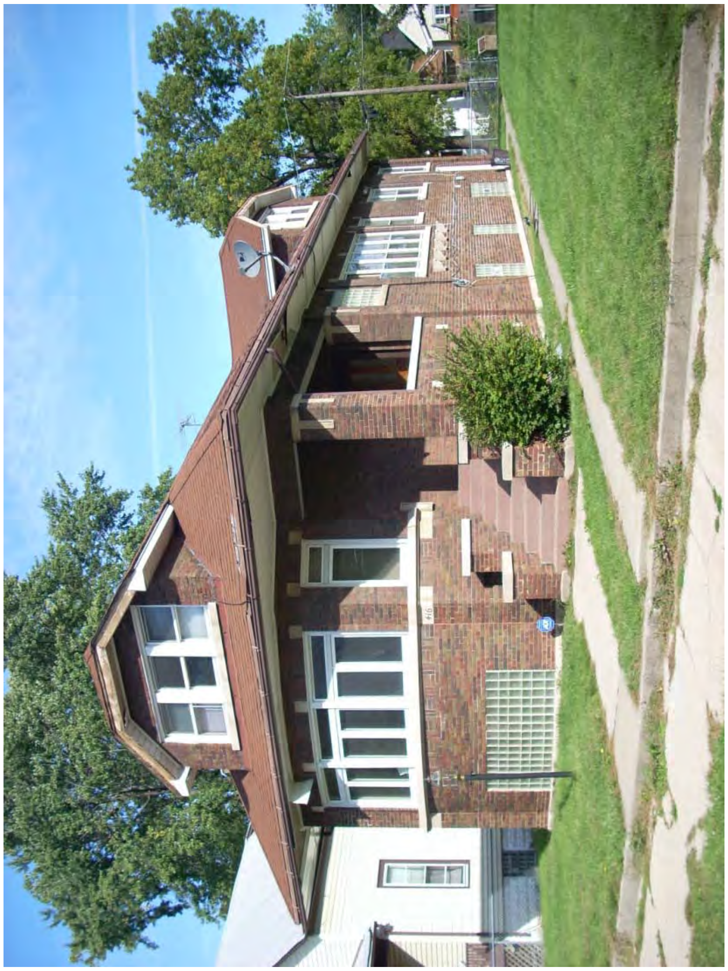
South and east façades of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story house in the Washington Heights community is situated on a raised basement with glass block windows. It is clad with brown brick and has a hip roof covered with asphalt shingles and overhanging eaves. There are hip-on-gable dormers on the front and side elevations, each of which has a strip of non-original one-over-one aluminum-sash windows. The house features a recessed corner porch with a single-light oak door, concrete steps, low brick sidewalls, and a brick corner pier. The front elevation's rounded living room bay has a series of casement windows and transoms. Detailing includes a brickwork soldier course above windows with decorative stone insert blocks and concrete sills. This is a good example of a brick Chicago Style Bungalow, a building type that was produced in the thousands throughout the city's undeveloped areas and in nearby suburbs during the 1910s and 1920s. This house does not feature sufficient distinguishing architectural features to be individually eligible for listing on the National Register.

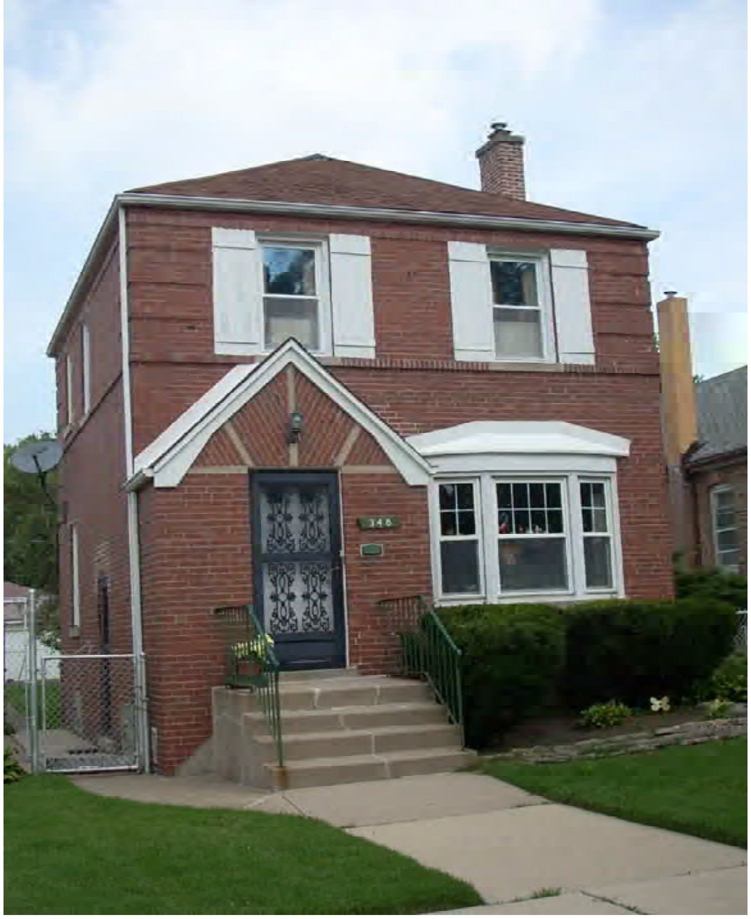
South façade of brick, two-story, single family residence.



Property Description: **Stories:** 2

This two-story, brick-clad house in Roseland has a square footprint and a hip roof covered with asphalt shingles. An off-center, projecting, gable-roofed vestibule with front door is accessed via a short flight of concrete steps with metal railings. The front elevation has a three-sided bay with a central eight-over-one window flanked by four-over-one windows, and the second floor has two one-over-one windows with wood shutters. Windows are modern replacements. Detailing includes brick banding on the second floor and concrete bands in the vestibule gable meant to simulate half-timbering. This house lacks architectural distinction; as a result, it is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Washington Heights community is situated on a raised concrete block basement. It is clad with synthetic siding and has a gable roof covered with asphalt shingles. Its front elevation features a hip-roofed full-width screened-in porch with concrete steps, metal pipe railings, a faux stone base, and supports comprised of faux stone pedestals topped by squat Doric columns. A pair of windows sheltered by a metal awning is situated in the gable. A two-story, gable-roofed, bay pavilion is situated along one of the side elevations. Windows throughout the house are non-original one-over-one aluminum-sash. This house lacks integrity, does not display distinguishing architectural features, and is not individually eligible for listing on the National Register.

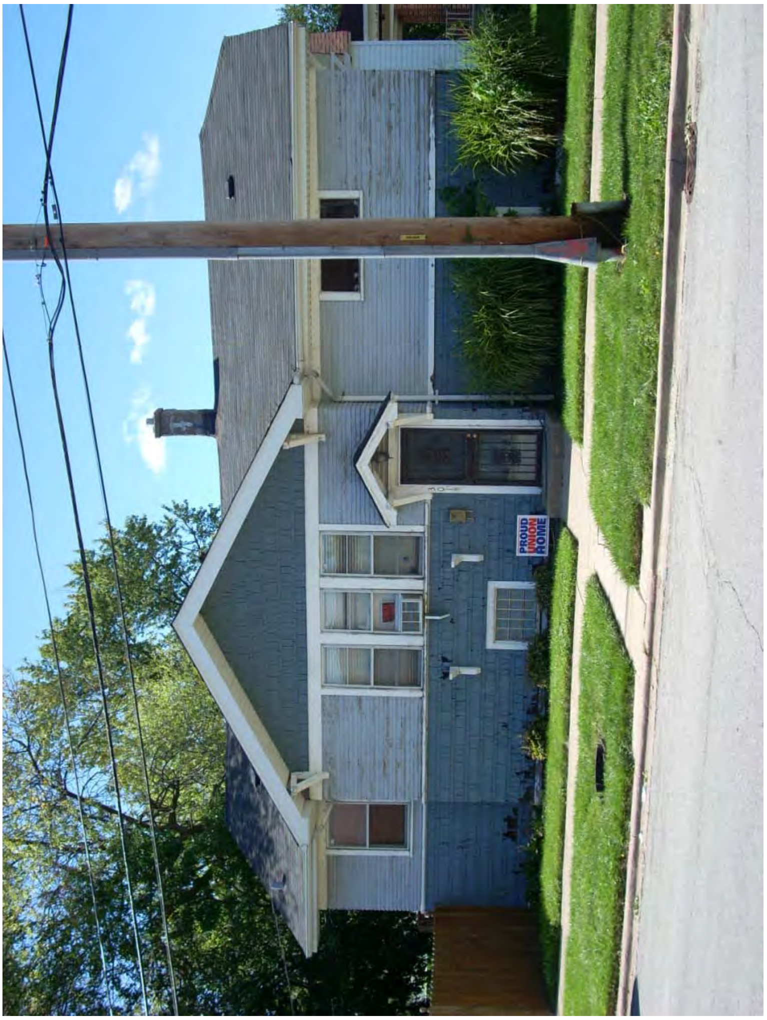
East (Princeton) façade of one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman bungalow is situated at the southwest corner of 103rd Place and Princeton Avenue in the Roseland community. It has a hip-on-gable roof covered with asphalt shingles and overhanging eaves with decorative knee braces located on the front gable section of the roof. The central portion of the house retains its original wood clapboard siding; the areas above and below are clad with wood shingles. Its 103rd Place elevation has a strip of three one-over-one windows, a strip of three casements, and a strip of three windows in the gable that appear to be casements. Its Princeton Street elevation has a metal storm door topped by a gabled hood with two knee braces, glass block basement windows, a strip of three one-over-one windows, a single one-over-one window, and a pair of casements. This house does not have sufficient distinguishing features to qualify as individually eligible for listing on the National Register.

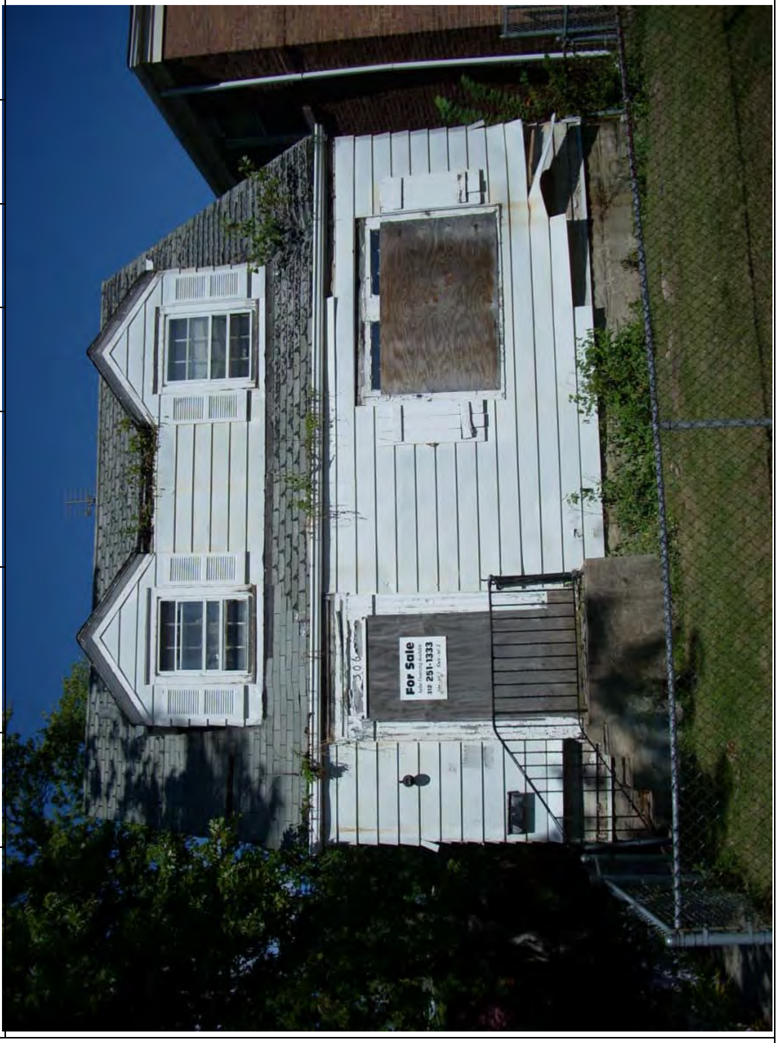
South façade of one-story, single-family, frame residence.



Property Description: **Stories:** 1

This one-story frame cottage in the Roseland community is clad with synthetic siding, has a side-gabled roof covered with asphalt shingles, and has two gable dormers with double-hung multi-sash windows that are visually connected with aluminum siding. The front elevation has an off-center door covered with plywood and a Classical surround consisting of simple wood pilasters and unadorned entablature. The front elevation also has concrete steps with metal railings and paired windows that are covered with plywood. This home does not have distinguishing features and is not individually eligible for listing on the National Register.

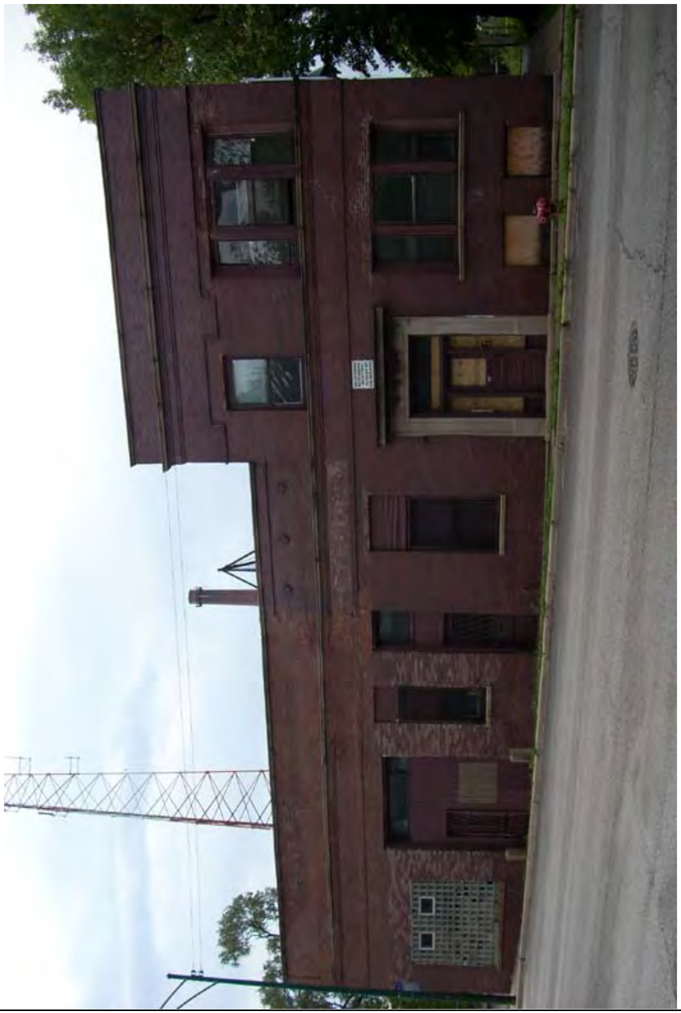
North façade of a brick, commercial building.



Property Description: **Stories:** 2

The two-story commercial portion of this building is identified as a “Hay, Grain & Feed” shop in the 1905 Sanborn while the one-story portion is identified as used for related storage. The buildings were joined at a later date. Both are clad in brown face brick and have flat roofs and parapets. The two-story section has an off-center entrance with an original wood door, sidelights, transom, and a stone surround with cornice, as well as a metal cornice. The glass panes in the sidelights and door have been removed and their openings in-filled with wood. It has bay windows on the first and second floors and an additional window opening above the entrance bay. All windows are comprised of one-over-one wood-sash. Detailing includes brick banding and a stone cornice. The one-story part has altered door and window openings, including one large window opening that has been in-filled with glass blocks. Side elevations are clad in common brick. This structure lacks architectural distinction and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This two-story frame building in the Washington Heights community has a gable roof covered with asphalt shingles that is obscured by a false front with faux stone siding and high stepped parapet. The first floor has two large window openings that are in-filled with glass block. The second floor has a non-original picture window flanked by one-over-one aluminum-sash windows. The building has a one-story flat-roofed wing. The wing's front elevation is clad with vertically laid wood boards above a brick base. It has a pair of non-original hollow core metal paneled doors with fanlights. The wing also features decorative modern angled wood pylons at its corner and along its side elevation. This building does not feature sufficient integrity to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story frame cottage in the Roseland community sits on a raised concrete block basement with glass block windows. It is clad with synthetic siding and has a gable roof covered with asphalt shingles. Its front elevation features a full-width wood porch with wooden steps, wooden railing, and supports consisting of faux stone piers topped by squat, square columns. It has an off-center hollow core metal door and a strip of three non-original three-over-one windows. This house does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story Craftsman style bungalow in the Roseland community is situated on a raised basement and clad with synthetic siding. The building has a front gable roof covered with asphalt shingles and overhanging eaves with decorative rafters. Its roof overhangs to shelter the full-width wood porch with supports consisting of low square wood columns atop synthetic-clad porch walls. The front elevation has an off-center non-original hollow core metal paneled door, a strip of three non-original double-hung windows, and an original wood casement window in the attic gable. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This two-story firehouse in the Roseland community is clad with light brown face brick and has a flat roof and a parapet with concrete coping. Its front elevation has a two-story projecting pavilion, an overhead garage door, two window openings, an off-center hollow core metal door on the first floor, and a strip of three windows and a single window on the second floor. All windows are non-original one-over-one aluminum sash. The spandrel area between the garage door and the windows above features a large stone sign plate inscribed with the words, “City of Chicago Fire Department.” The spandrel area between the corner door and window above has a metal plate identifying the 1917 construction date and the names of a series of people associated with the building’s construction, including the mayor, alderman, city architect, and contractor. Detailing includes stone door and window surrounds on the first floor, bracketed stone window lintels, concrete belt courses, and brick pilasters topped by stone panels with the City of Chicago’s “Y” motif and decorative scrolls. The “Y” motif is also situated above the off-center door. This building is recommended as eligible for individual listing on the National Register under Criterion C for architecture. It is a rare extant example of an early twentieth-century neighborhood firehouse in Roseland, has largely retained its original building materials and detailing, and still functions as a firehouse.

Property Use **Historic:** Industrial **Current:** Industrial	
Date of Construction: 1911 **Architect's Name:** William G. Krieg **Builder/Contractor:** Not in CHRS	
Architectural Style: Prairie	
Prepared By: J. Martinez, M. C. Bird, J. Guarino **Photo By:** Steve Katz, HAARGIS **Date:** 24 September 2012	

Property Description: **Stories:** 2

The two-story Prairie style Roseland Pumping Station is clad in brown brick. It has a high limestone watertable, a flat roof, parapet, and two square towers at the corners of the front (Roseland) elevation. The front elevation features a projecting, two-story flat-roofed entrance pavilion with a pair of centrally located glass double-doors, sidelights, and a stone panel above that features the City of Chicago's "Y" emblem in metal. The entrance has a smooth stone surround. Above the entrance is a limestone panel incised with the words: "City of Chicago Roseland Pumping Station." Detailing on the entrance pavilion includes brick pilasters with stone bases, coping, and geometric motifs. The parapet is clad in limestone and features decorative geometric motifs. The building's fenestration is largely comprised of multi-paned steel sash windows, some of which have transoms.

This is an excellent intact example of a community pumping station with fine integrity that still functions in its original use. It is recommended as individually eligible for the National Register under Criterion C for architecture as a well-preserved example of a community pumping station designed in the Prairie style.

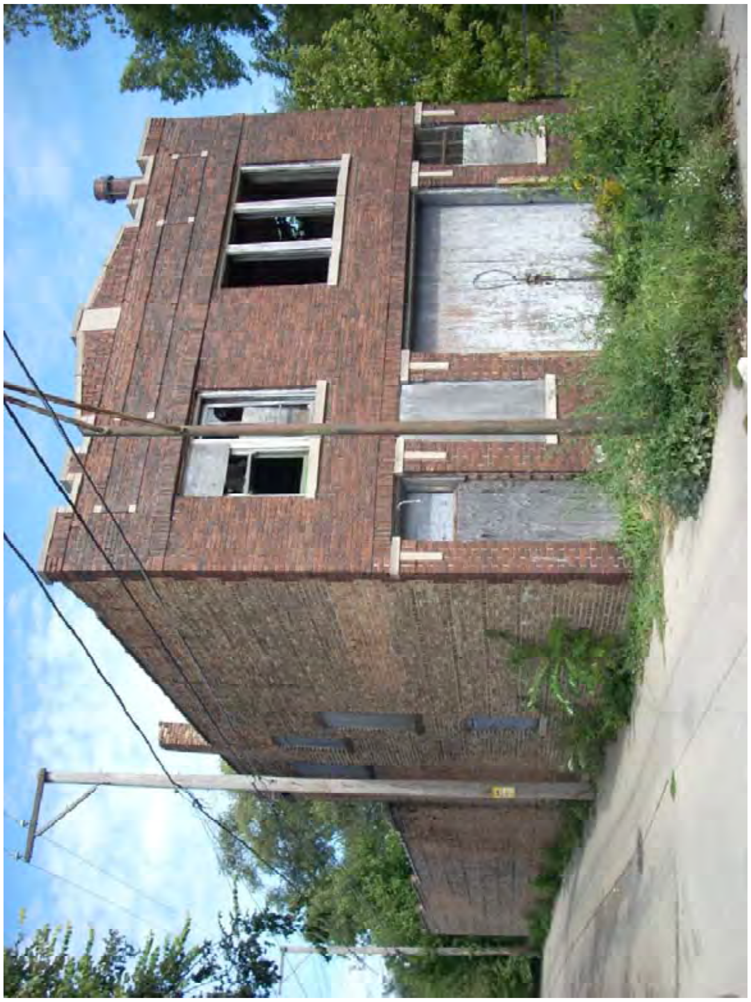
South façade of a brick, two-story, mixed-use building.



Property Description: **Stories:** 2

This two-story building in the Roseland community, a former warehouse later converted to residential use and now abandoned, has a flat roof and shaped parapet with concrete coping. Its front elevation is clad in brown face brick and its side and rear elevations are clad with common brick. The front elevation has an off-center door opening with transom, a garage door opening, and two window openings, all of which are covered with plywood. A portion of one of these window openings is visible and reveals a multi-paned upper sash. The second floor has a pair of window openings and a strip of three window openings, all of which have had their glass panes removed. Detailing includes concrete sills and insert blocks between the first floor openings, two brick soldier courses, and brick stringcourses at the parapet level. This building does not have sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1

These one-story brick-clad flat-roofed light industrial buildings in Roseland have overhead garage doors and a hinged hollow metal door opening. The earlier building has a parapet with tile coping. Original window openings along the side elevations have been in-filled with brick or glass blocks with central casement windows. The newer building has a flat roof. These buildings lack any architectural distinction and are not individually eligible for listing on the National Register.

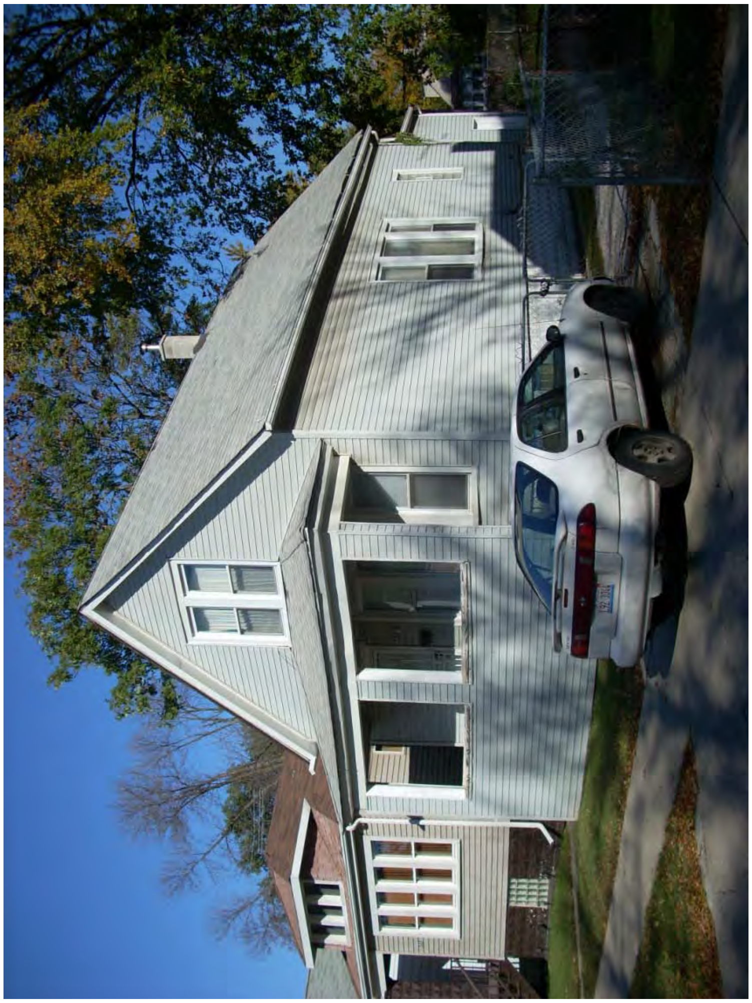
South and east façades of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. The front elevation has a full-width, hip-roof, wood porch with low, synthetic-clad walls, boxed supports, and side-facing steps. The residence also has an off-center metal storm door, a three-sided bay window on the first floor, and paired windows in the gable, all of which feature non-original one-over-one aluminum sashes. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This building consists of a central, hipped-roof, brick clad structure on a raised basement that was constructed in 1914. Later, shed-roof, vinyl clad additions were constructed on the front and rear of the central brick portion. The front elevation features an off-center porch with concrete steps, metal railings and supports topped by a metal awning roof. It also has a hollow metal front door and a five-sided bow window. This home lacks both integrity and architectural distinction and is not individually eligible for listing on the National Register.

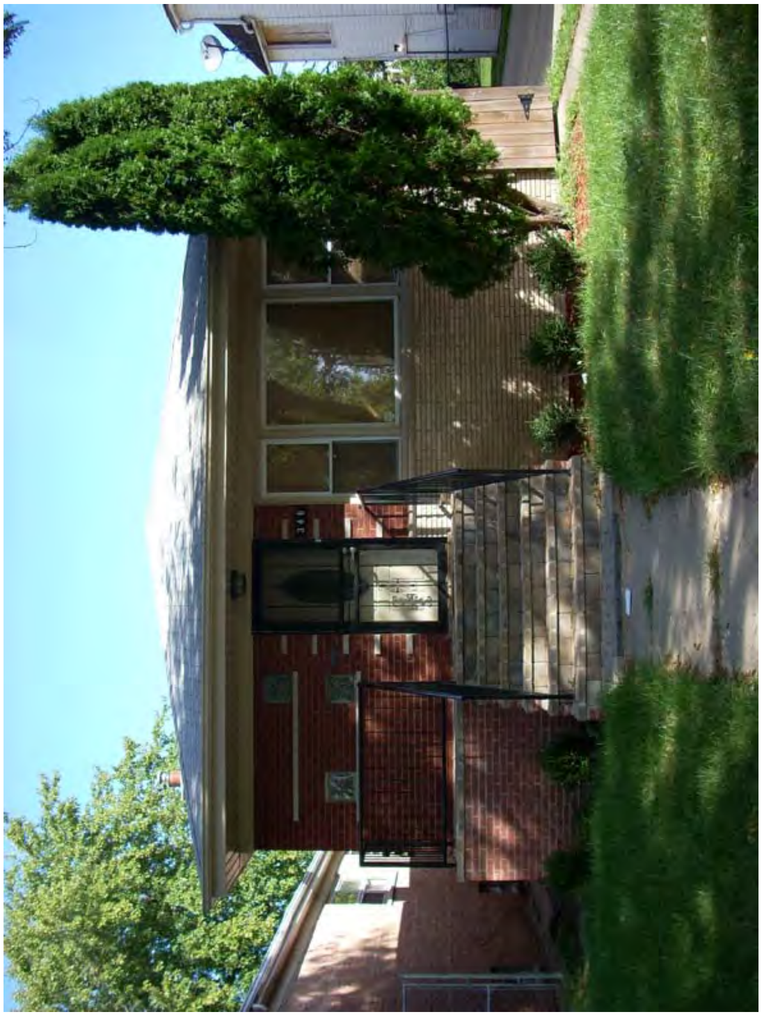
South façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story, brick-clad house in the Roseland community sits on a raised basement with glass block windows. The building has a hip roof covered with asphalt shingles, overhanging eaves, and a large hip-roofed rear wing. Its projecting gable-roofed front wing has a recessed corner porch with low brick walls, a brick corner pier, concrete steps with metal railings, and a door tucked into the side of the living room bay. Its front elevation features two large picture windows, a glass block window, and a bulls-eye window in the gable. Other windows are non-original double-hung. Detailing includes faux stonework at the corners of the basement, concrete sills, glass blocks, and keystone-like blocks surrounding the bulls-eye window. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

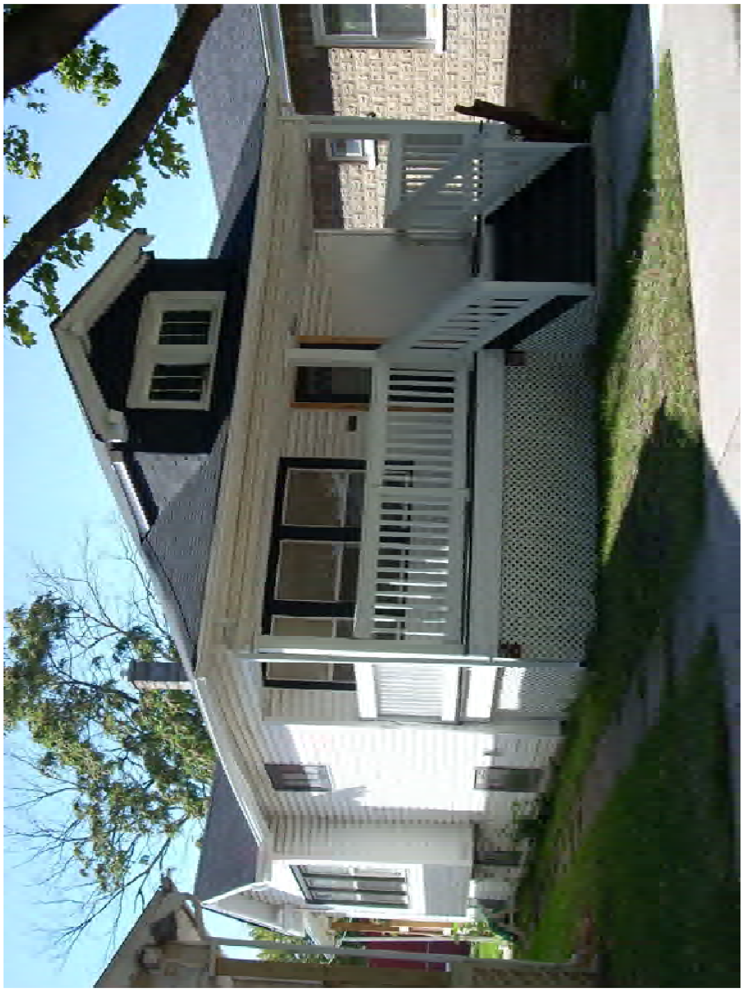
North façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story bungalow in the Roseland community is situated on a raised brick basement with glass block windows and is clad with synthetic siding. The building has a hip roof covered with asphalt shingles, overhanging eaves, and a hip dormer with a pair of original wood casement windows and decorative rafters. Its roof overhangs to shelter a full-width wood porch with straight railings and posts. The front elevation has an off-center non-original hollow-core metal door and a strip of three non-original one-over-one aluminum-sash windows. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

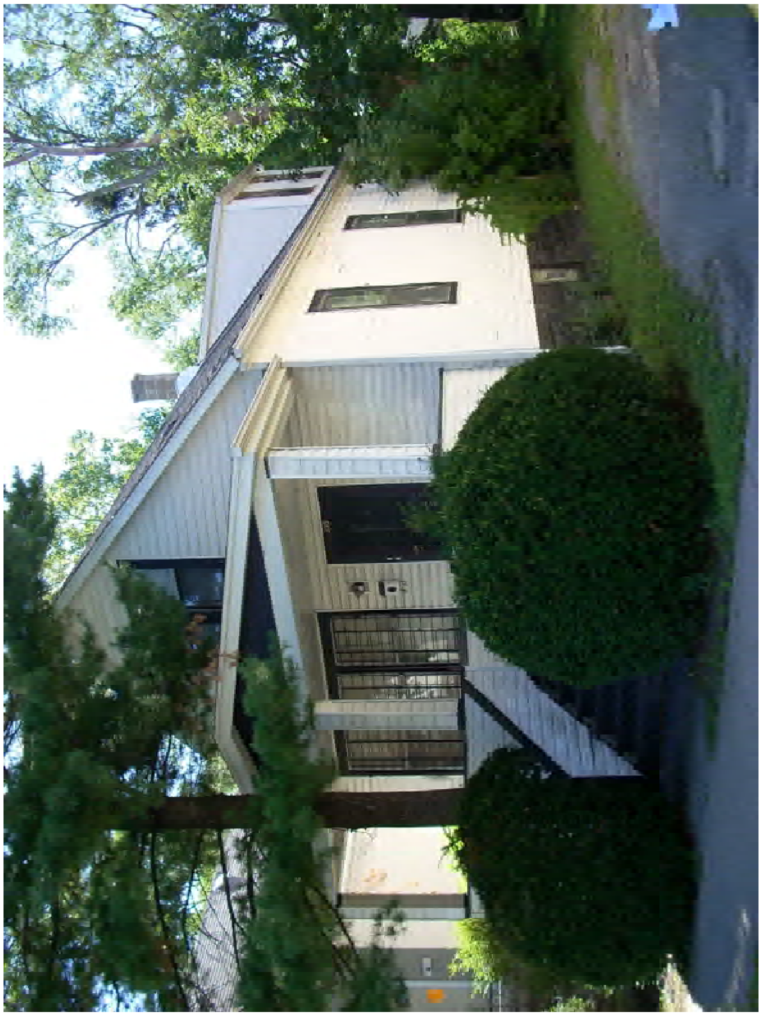
North façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised concrete block basement and is clad with synthetic siding. The building has a front gable roof covered with asphalt shingles and a shed dormer along its west elevation. It has a full-width, gable-roof, wood porch with low walls and three boxed supports all covered with aluminum siding. The front elevation has an off-center door with a metal storm door, a strip of three windows on the first floor and a pair of windows in the attic, all of which are non-original one-over-one aluminum-sash. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

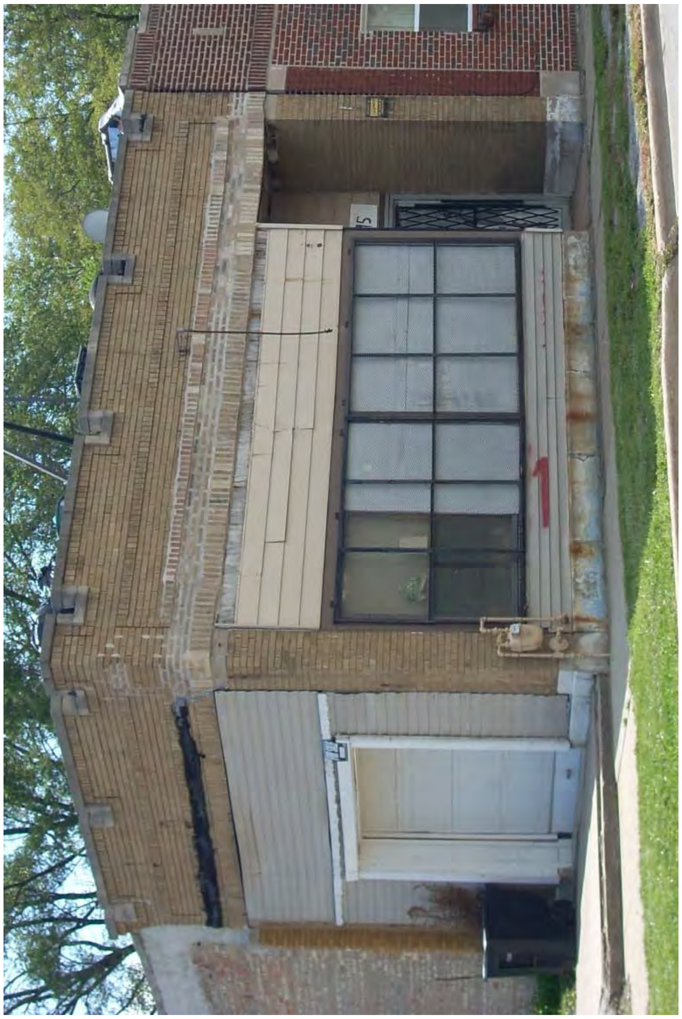
North and east façades of a brick, one story, commercial building.



Property Description: **Stories:** 1

This one-story commercial building in the Roseland community has a flat roof, castellated parapet, a brick panel at the cornice line, and concrete coping. Its front elevation is clad in yellow face brick and has a recessed, off-center hollow core metal door that is non-original. Aluminum siding has replaced this door's original transom and its original storefront has been in-filled with a strip of fixed pane windows with aluminum siding above and below. The north portion of its east elevation is also clad in yellow face brick and has been altered with the insertion of an overhead metal door that is surrounded by aluminum siding. This building lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story home at the northwest corner of 107th Street and Eggleston Avenue in the Roseland community is situated on a raised brick basement. The building has a hip roof covered with asphalt shingles and overhanging eaves. The front elevation is clad with faux stone below the sill line and red brick above. The building has an off-center door behind a metal storm, concrete steps with metal railings, and a picture window flanked by one-over-one aluminum-sash windows. Detailing includes faux stone blocks flanking the front door and two horizontal strips of faux stone, each with a glass block, on the front elevation. The side (Eggleston) elevation is clad in red brick and has two pairs of four-over-one windows. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

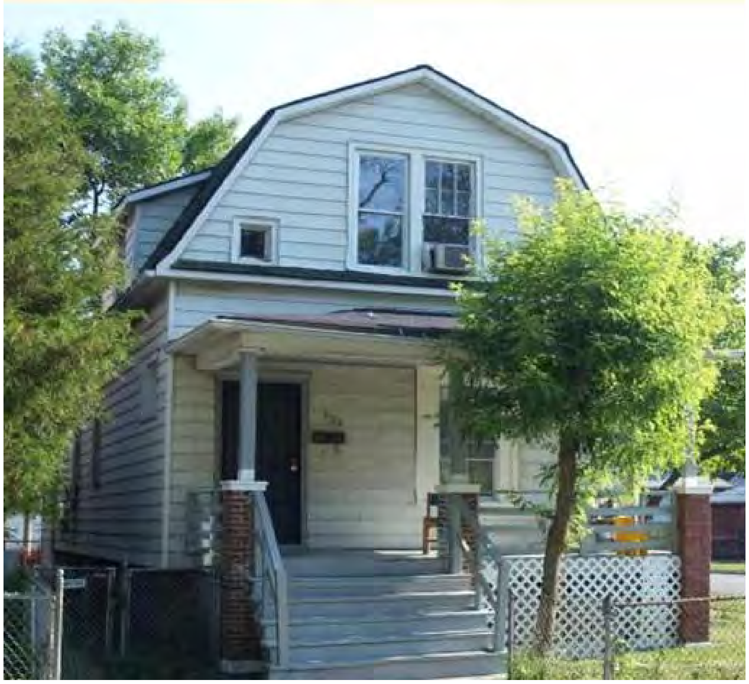
South façade of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This 1.5-story house at the northwest corner of 108th Street and Princeton Avenue in the Roseland community is situated on a raised brick basement and is clad with synthetic siding. The building has a gambrel roof covered with asphalt shingles. Its front (108th Street) elevation has a full-width, hip-roofed, wood porch with frieze band and supports consisting of three brick piers topped by squat wood posts. The building has an off-center door and a single double-hung window on the first floor. A pair of double-hung windows and a small casement window provide light to the attic space. Its Princeton Avenue elevation has a three-sided window bay. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

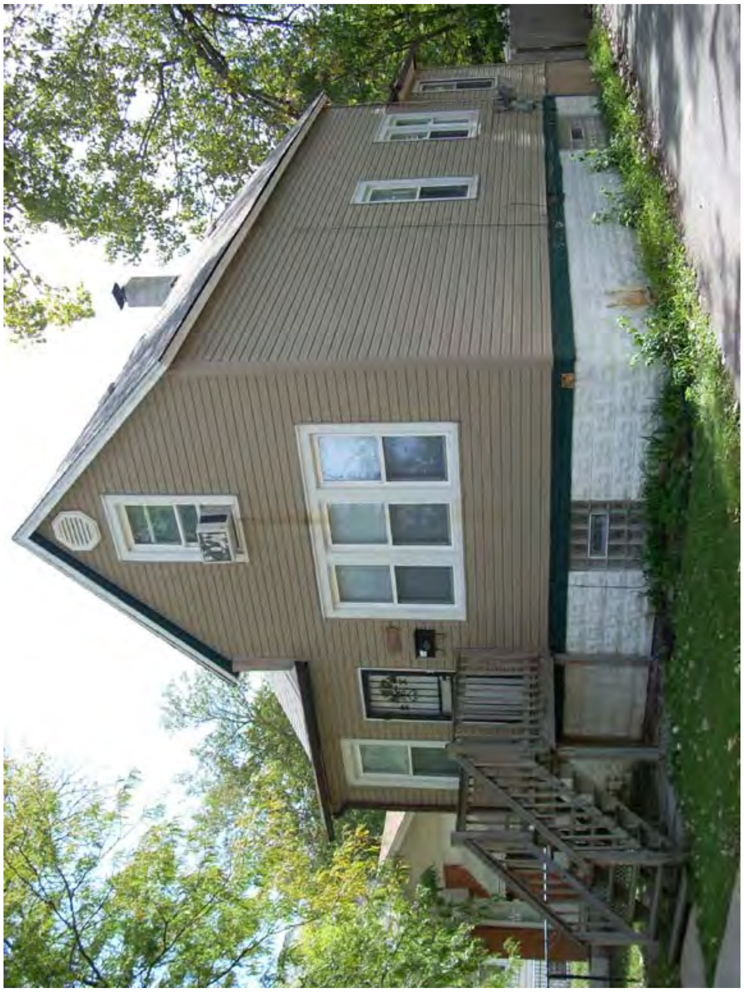
North façade of a 1.5- story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a cross-gable roof covered with asphalt shingles. The front elevation has an off-center door behind a metal storm door, non-original wood steps and railings, and five non-original one-over-one aluminum-sash windows: four on the first floor and one in the gable. Review of the 1938 Sanborn and the assessor's 2007 photograph suggests that while the front and rear porches are original to the house, a second story was added to the residence between 1938 and 2007. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

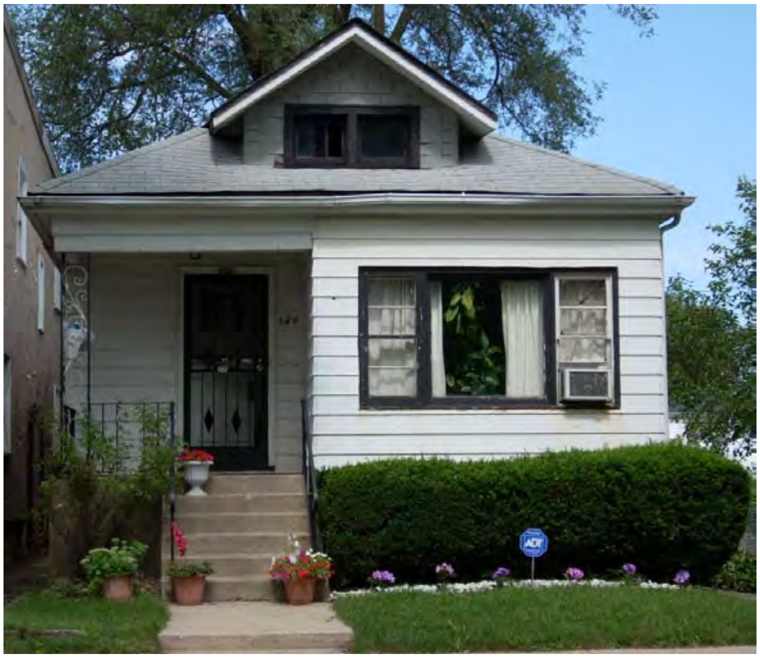
South façade of one-story, frame, single family residence.



Property Description: **Stories:** 1

This one-story home in the Roseland community is clad with synthetic siding. It has a hip roof covered with asphalt shingles and a gabled dormer with two windows that appear to be casements. Its front façade features an off-center door within a recessed porch with concrete steps, metal railings and corner support, and a picture window flanked by double-hung windows. This home lacks integrity and architectural distinction and is not individually eligible for listing on the National Register.

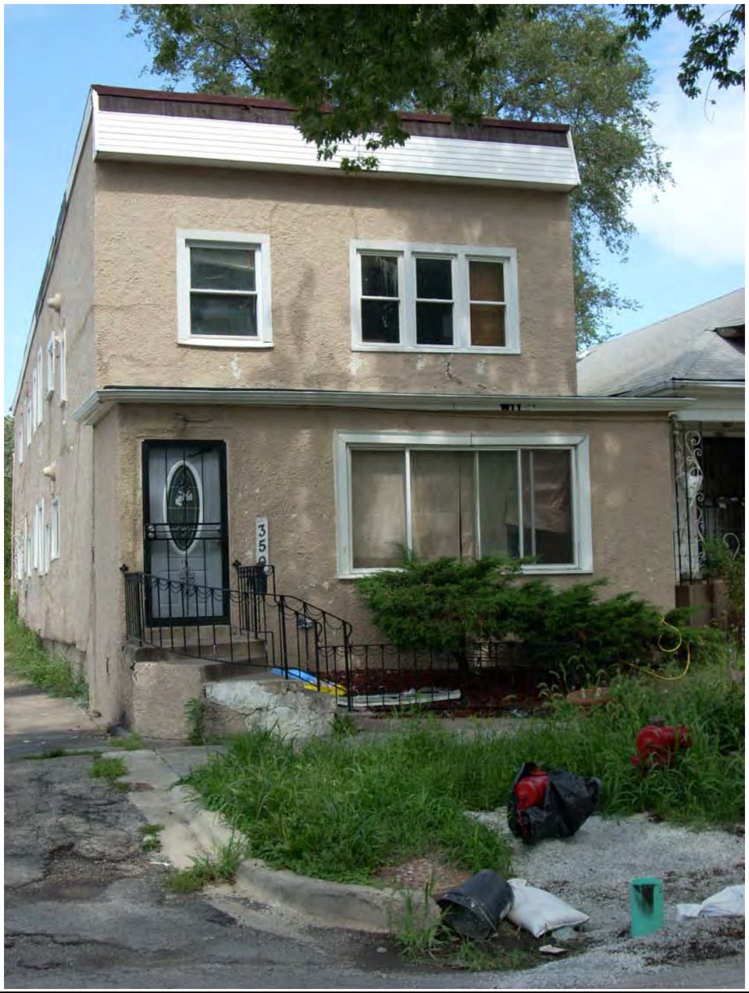
South façade of two-story multi-family residence.



Property Description: **Stories:** 2

This two-story home in the Roseland community has “cemented” cladding material, which is original per the 1911 Sanborn map. Its front elevation has an enclosed, full-façade, flat-roofed porch with an off-center metal core door, concrete steps and metal railings, and a strip of four windows that appear to be sliding windows. The second floor of the front elevation has four one-over-one windows. This home lacks integrity and architectural distinction and is not individually eligible for listing on the National Register.

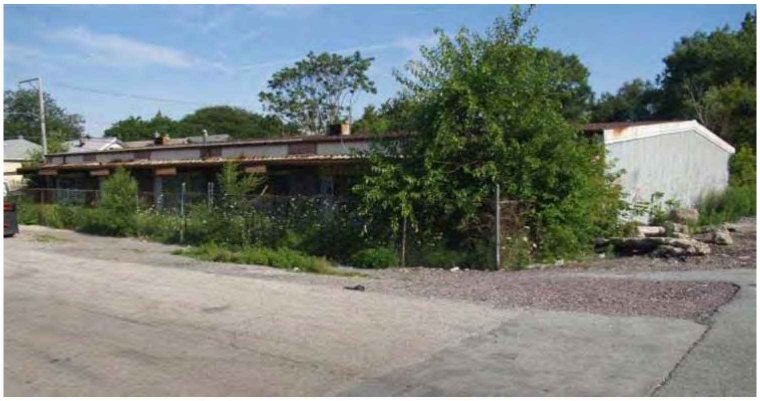
South and east façades of industrial, brick and metal storage shed.



Property Description: **Stories:** 1

This one-story, side-gabled, metal shed on the vacated South Shore Iron Works property is partially obscured by foliage. The front elevation is clad in buff brick and contains a series of hollow metal doors, each flanked by three windows to one side; many are covered with plywood. A full width metal canopy is present on the front façade. The gable ends and rear elevation are clad in corrugated sheet metal. This building lacks architectural distinction and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This property includes a two story, flat-roofed concrete block building associated with South Shore Iron Works, manufacturers of structural steel. The building is difficult to see from the public right-of-way. The first floor has one-over-one windows below a metal awning and the second floor has glass block windows. Portion of the building has had its roof raised, creating more height for the interior workspace. The Cook County Assessor's photo shows large sliding metal doors on the warehouse façade. This structure lacks architectural distinction and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This two-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a flat roof and parapet. Its front elevation has a full-width hipped-roof wood porch with square wood posts and a straight railing balustrade. The porch sits atop piers of rusticated concrete block. The porch also features an off-center door with a metal storm door. There are two slightly rounded window bays—one on the first floor and one on the second—and an additional single window on the second floor. Windows are non-original one-over-one aluminum sash. Detailing includes an aluminum-covered cornice. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

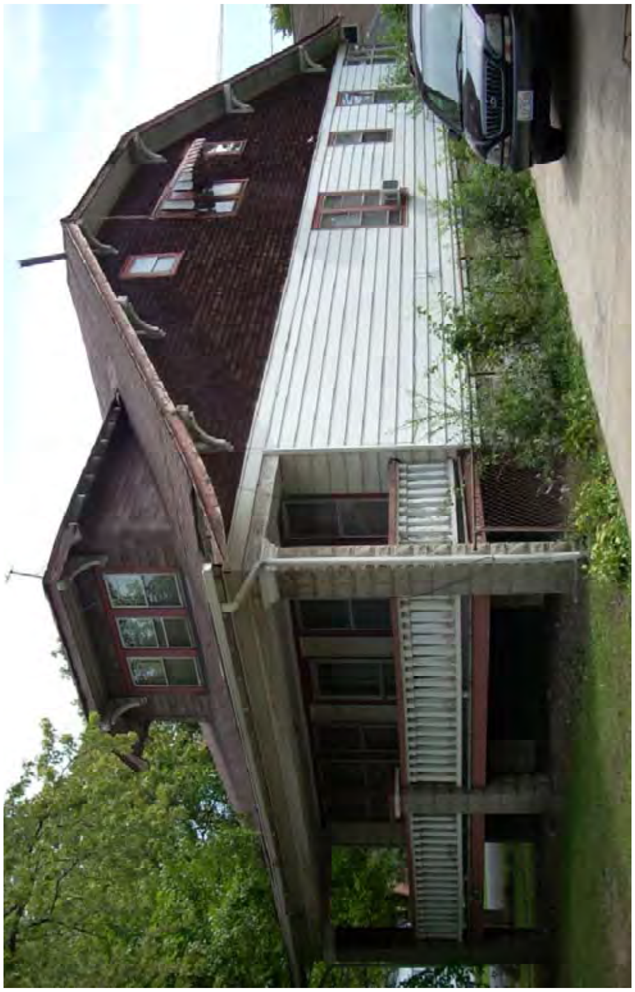
North and west façades of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman style house in the Roseland community is situated on a raised concrete block basement and is covered with synthetic siding and wood shingles. The building has a side hip-on-gable roof, overhanging eaves. There are decorative wood brackets and a hip-on-gable dormer with bracketed, overhanging eaves. There are three double-hung wood-sash windows with aluminum storms in the gable. Asphalt shingles clad the roof and the dormer. The roof has a wide overhang that serves as the roof for a full-width wood porch that has faux stone piers and wood railings, but no steps. The front elevation has a centrally located door that appears to be oak with a glass pane, which is flanked by three windows on either side, all of which are double-hung wood-sash with aluminum storms. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

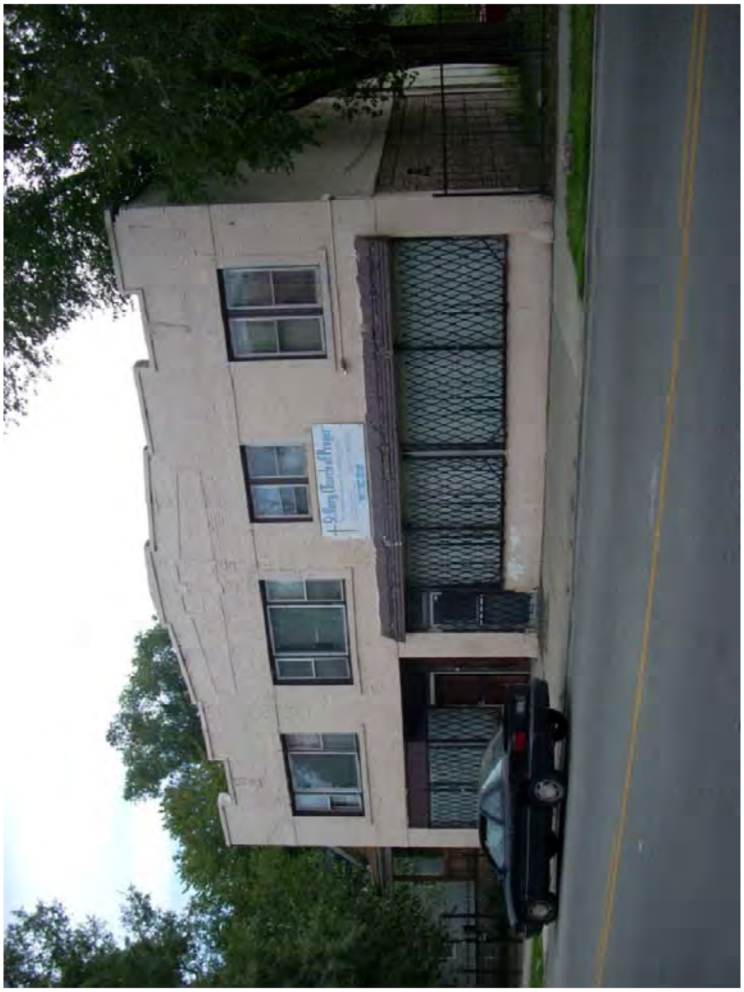
North façade of a brick, two-story, mixed-use building.



Property Description: **Stories:** 2

This two-story former commercial building (now a storefront church) in the Roseland community is clad with painted brick and has a flat roof and a stepped parapet. The first floor of the front elevation has two storefronts with strips of single-pane windows and non-original doors with transoms. The second floor has two groups of picture windows flanked by one-over-one windows and two pairs of one-over-one aluminum-sash windows. Detailing includes concrete coping and sills, a brick stringcourse, and a brick panel along the cornice line. This building lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

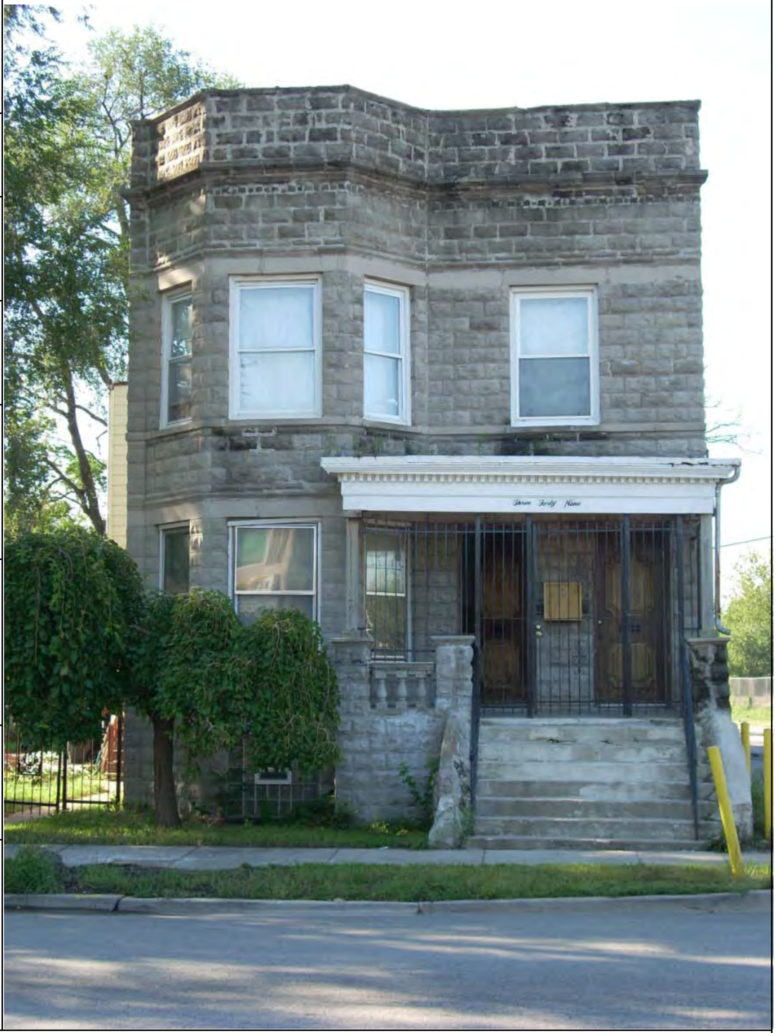
South façade of two-flat greystone residential building.



Property Description: **Stories:** 2

This two-flat greystone residential building in the Roseland community has a flat roof and parapet. Its front elevation features a full-height window bay pavilion with fenestration comprised of one-over-one replacement windows. It has an off-center porch with two entrances that feature non-original wood doors, stone steps, metal and stone railings, and wood columns supporting a flat wood roof with dentil molding. Detailing includes a stone sill courses, lintels, beltcourses, and cornice.

The City of Chicago has recognized this building type through its Historic Greystone Initiative, which promotes the preservation of Chicago’s ornate, limestone-clad homes by offering technical assistance and financial resources to property owners. Although this is an example of the greystone residential building type, it does not possess sufficient distinguishing architectural characteristics to qualify as individually eligible for listing on the National Register.

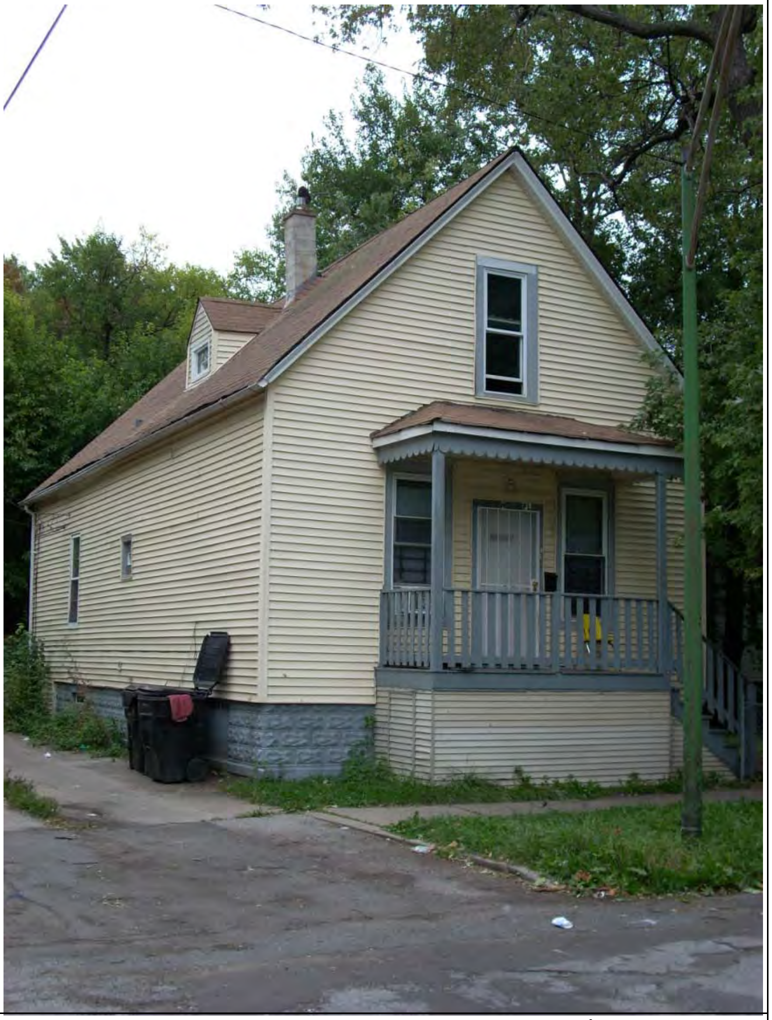
South and west façades of single-family, 1.5-story, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a front gable roof with asphalt shingles and a small dormer. The front elevation has a centrally located, partial-width, hipped-roof porch with scallop detailing at the roofline, an aluminum-clad base, straight wood posts and railings (non-original), and steps on the side. It has a centrally located entrance with a metal storm door flanked by a window on either side and has a single window in the gable. Windows are non-original one-over-one aluminum-sash. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

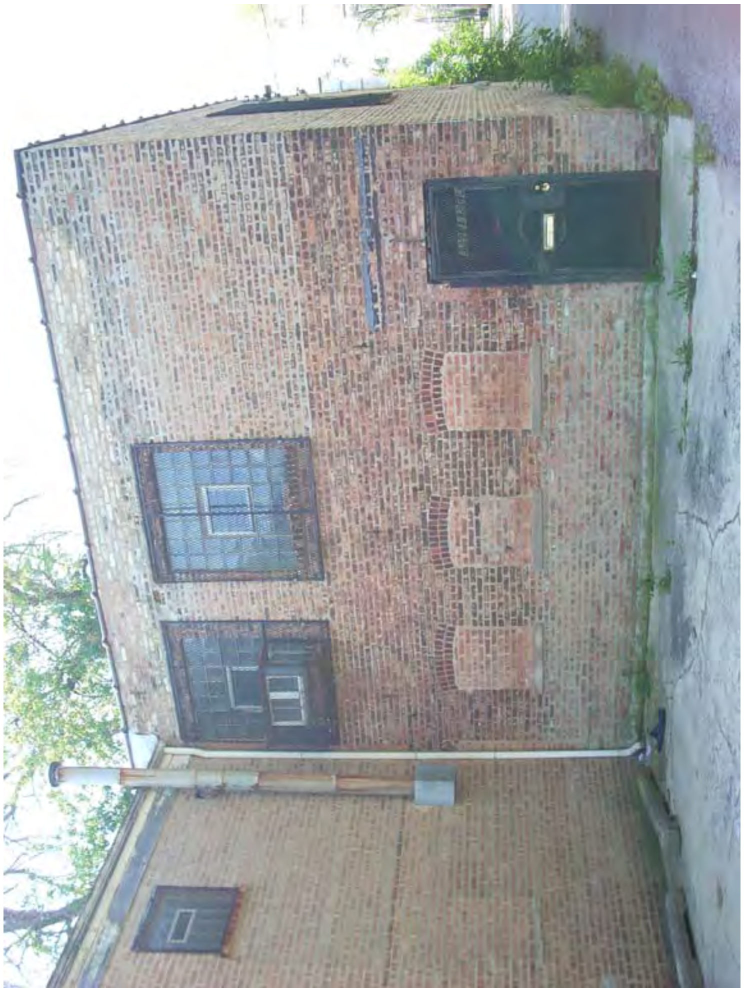
North façade of a brick, two-story industrial building.



Property Description: **Stories:** 2

This two-story, brick-clad, light industrial building in the Roseland community has a flat roof, parapet with coping, and a T-shaped footprint. The front segment of the building was a one-story building erected in 1908. Sometime after 1939, a second story and a rear wing were added. The original segment has an off-center door and the outline of three former window openings (with brick arched lintels and stone sills) that have been in-filled with brick. The second floor and the rear wing have glass block window openings with small ventilating louvers. This building lacks integrity and distinguishing architectural features; it is not individually eligible for listing on the National Register.

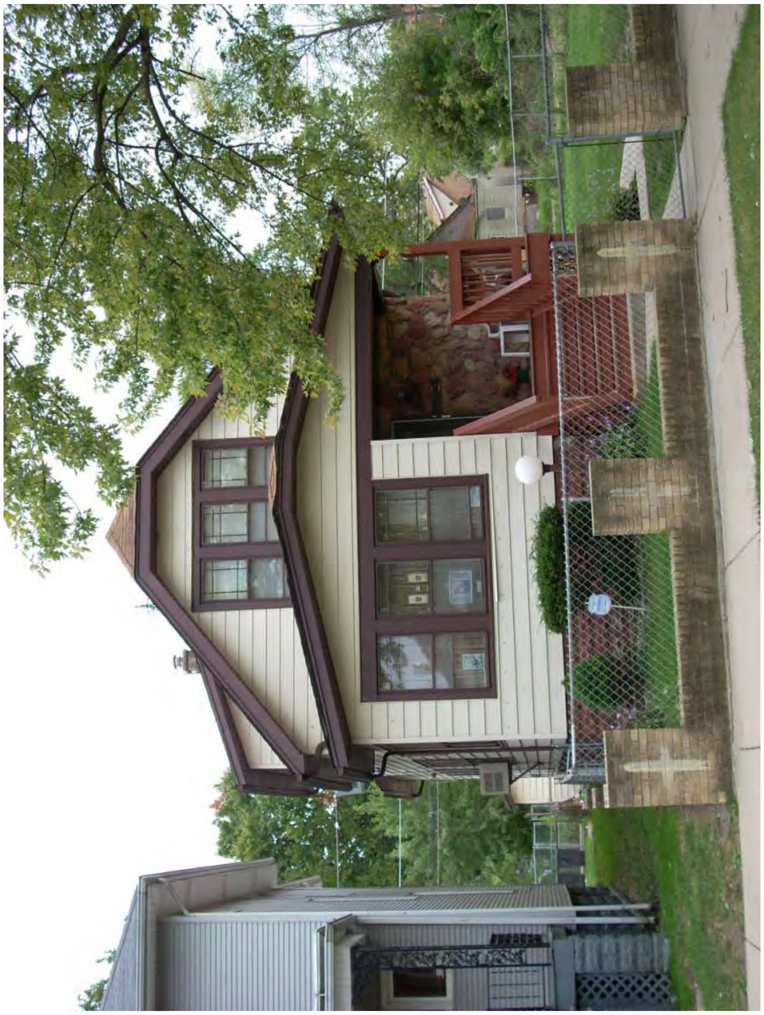
North façade of 1.5-story, single-family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a hip-on-gable roof with asphalt shingles. The front elevation has a gable-roofed full-width porch, half of which is enclosed, covered with synthetic siding, and surrounded by non-original multi-paned aluminum-sash windows with some original wood-sash windows. The open corner of the porch has a wood post, wood steps and railings (non-original), and an entrance with a metal storm door that is surrounded by faux stone siding. The hip-gable area has a strip of three double-hung windows. Both side elevations have shed-roofed wall dormers. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

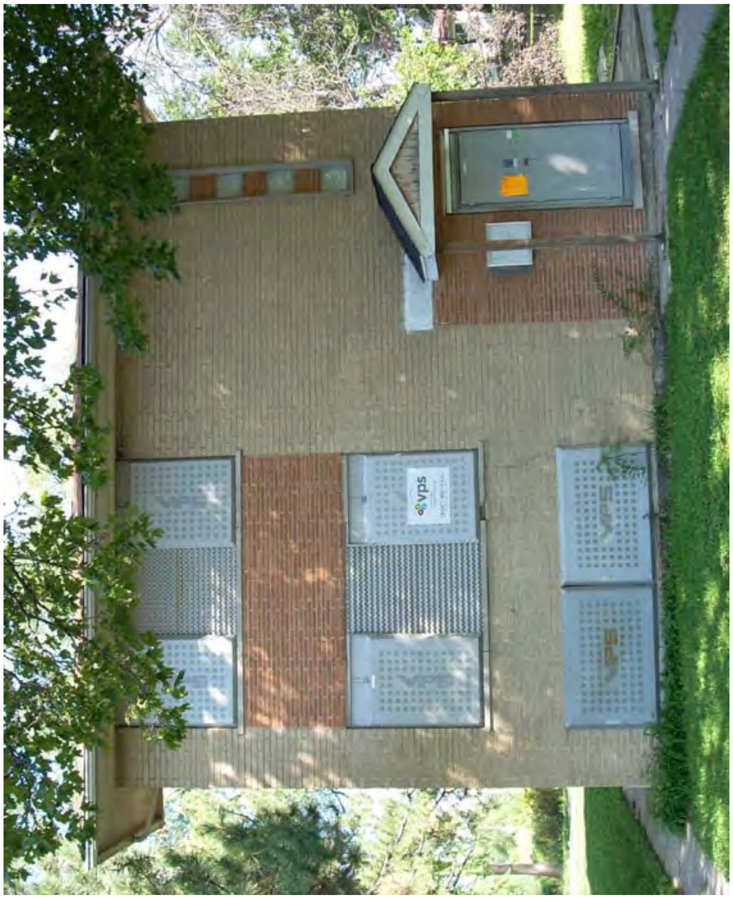
South façade of a brick, two-story, multi-family residence.



Property Description: **Stories:** 2

This two-flat apartment building is situated on a raised basement and has a hip roof covered with asphalt shingles. Its front façade is clad in buff brick and has an off-center metal door, a vertical strip of decorative glass blocks above the porch hood, and six window openings: two each in the basement, first, and second floors. All window openings are covered with metal panels. This building does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

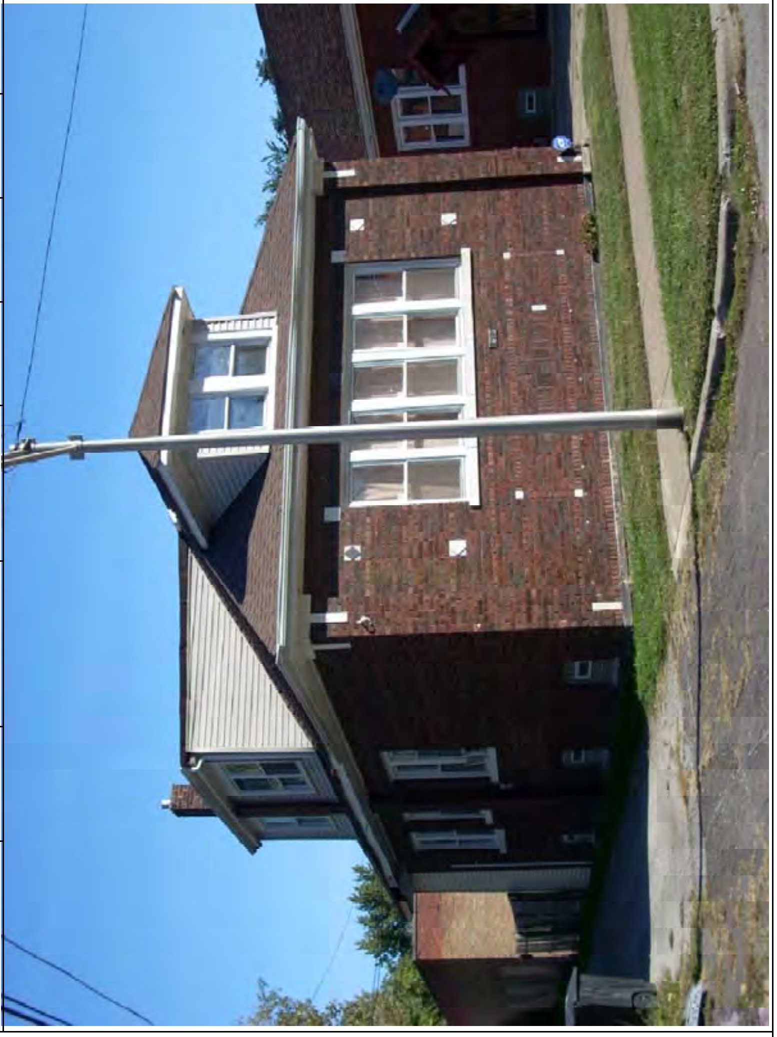
South and west façades of one-story, brick, single family residence.



Property Description: **Stories:** 1

This one-story brick bungalow in the Roseland community is situated on a raised basement with glass block windows and is clad with brown face brick. The building has a hip roof covered with asphalt shingles, a hip dormer with two windows on its front elevation, and a shed dormer with three windows on its west elevation. Both dormers are covered with synthetic siding. The front elevation has a strip of five windows. Windows throughout the house are non-original one-over-one aluminum-sash of varying sizes with the exception of a casement window along the east elevation. The main entrance is situated along the east elevation and consists of a hollow core metal door topped by a bracketed wood gabled hood. Detailing includes brick corner pilasters, concrete sills, and decorative square insert blocks. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

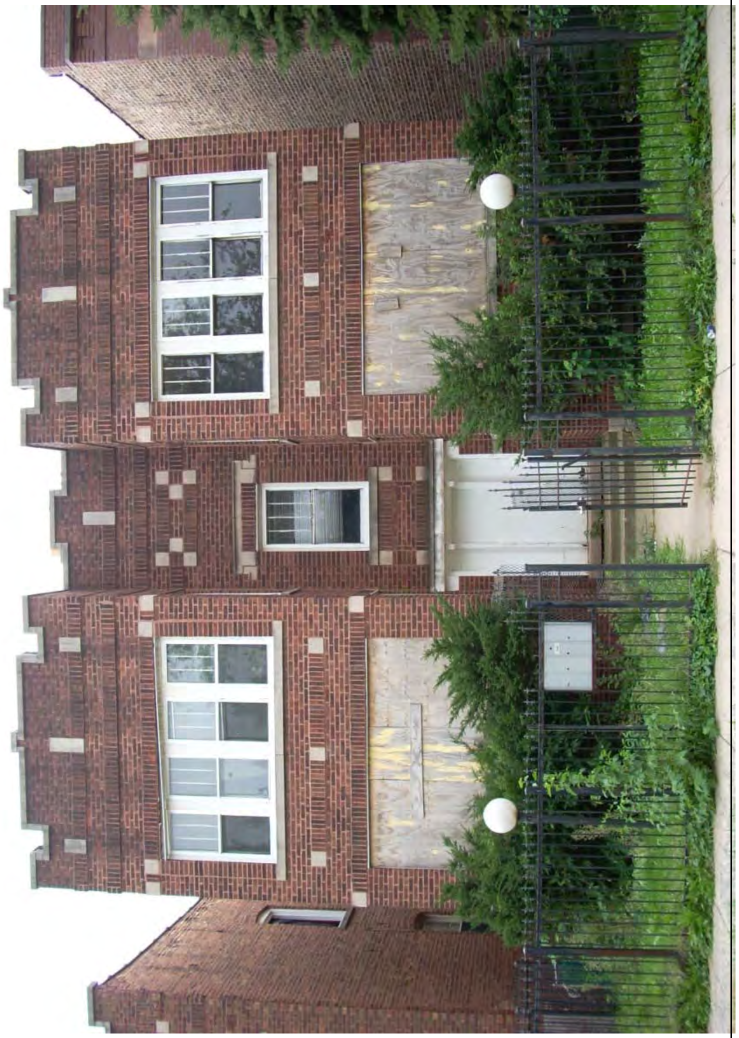
North façade of two-story, brick, four-flat residence.



Property Description: **Stories:** 2

This two-story four-flat apartment building in the Roseland community has a flat roof and castellated parapet with concrete coping. The front elevation is clad with brown face brick, has two full-height enclosed sun porch pavilions, and a centrally located entrance with sidelights that have been boarded over. The first floor windows have been covered with plywood. Second floor fenestration features two strips of three-over-one wood-sash windows. An additional three-over-one wood-sash window is situated above the entrance. Detailing includes brick soldier courses with stone coping and insert blocks. This building lacks sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

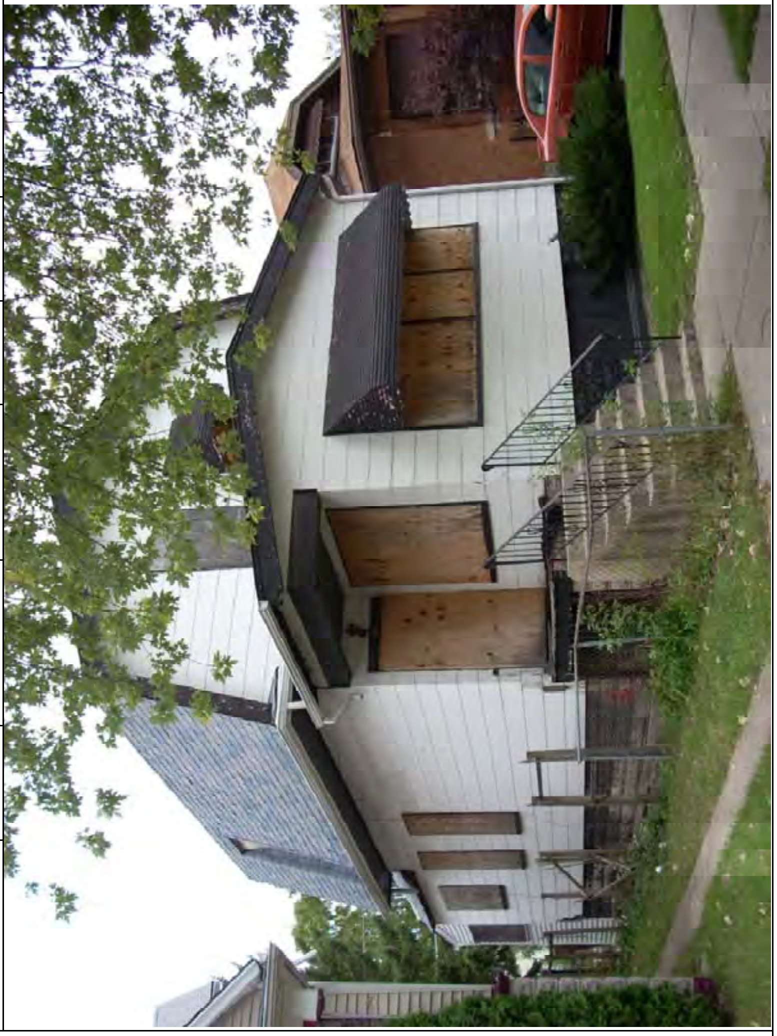
South façade of 1.5-story, single-family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Roseland community is situated on a raised concrete block basement and is covered with synthetic siding. The building has a gambrel roof covered with asphalt shingles that overhangs the side elevations. The front elevation has a gable-roofed full-width porch, most of which is enclosed and covered with synthetic siding. Windows on all three sides of the house are covered with plywood. The off-center door is also covered with plywood and accessed via concrete steps with metal railings. There is a synthetic-clad addition on the rear elevation. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

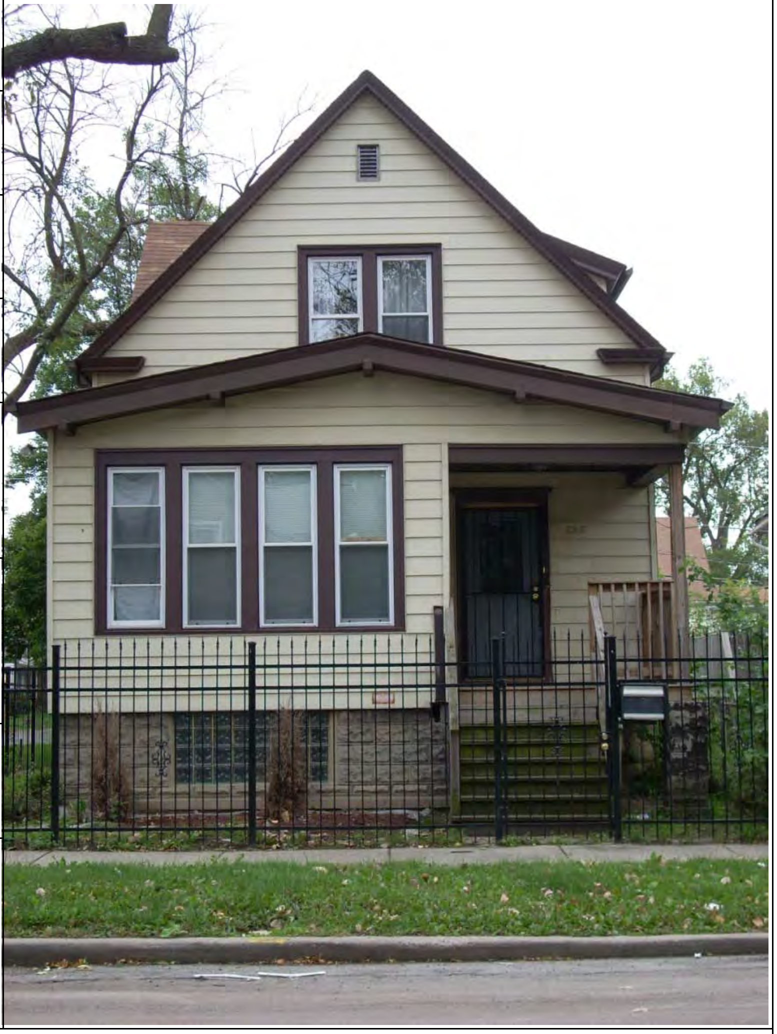
North façade of 1.5-story, single-family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house at the southwest corner of 113th Street and Yale Avenue in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a front gable roof with asphalt shingles. The front elevation has a gable-roofed full-width porch, most of which is enclosed with synthetic siding and surrounded on all three sides by one-over-one aluminum-sash windows. The off-center entrance with metal storm door is set within the open corner of the porch. The open part of the porch has a non-original wood support, steps and railings. A pair of windows is situated in the gable. Windows throughout the house are non-original one-over-one aluminum sash. The east elevation has a first floor window bay and both shed and gable wall dormers. The west elevation has a shed wall dormer. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

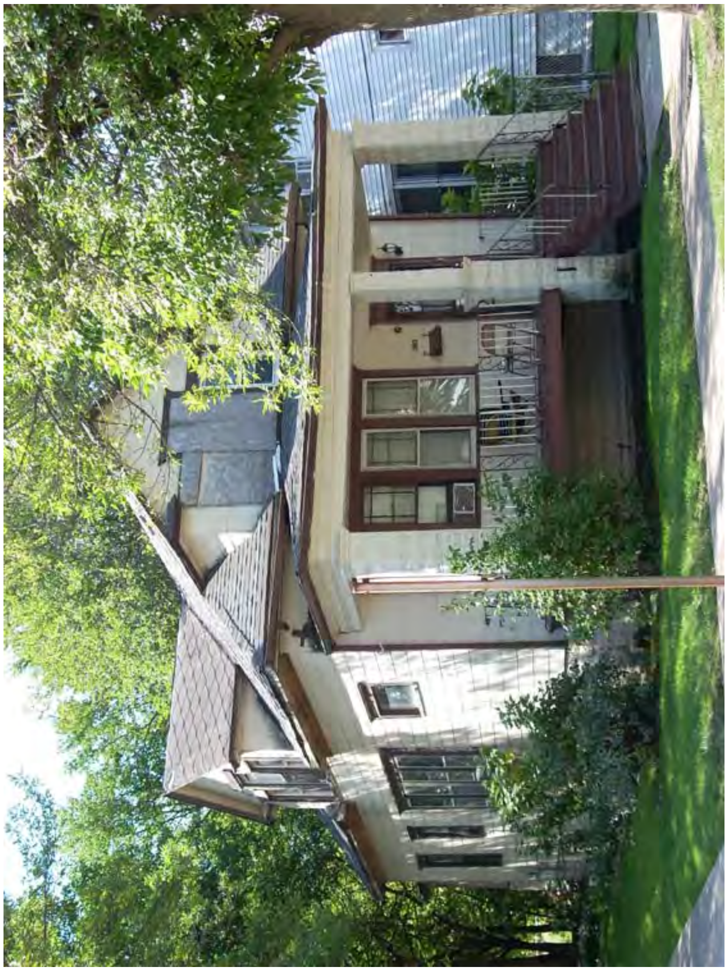
North façade of a one-story, single-family, frame residence.



Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised concrete block basement and clad with wood siding. It has a hip roof covered with asphalt shingles and gable dormers. It has a full-width, hip-roof, wood porch with metal railings, an unadorned frieze band, and supports consisting of two faux stone corner piers and one low faux stone pedestal topped by a square wood pier. Its front façade has an off-center door and a strip of three non-original double-hung windows. Both the front and side dormers each feature a strip of three windows, although those on the front façade dormer are covered with plywood. This home lacks integrity and does not have sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

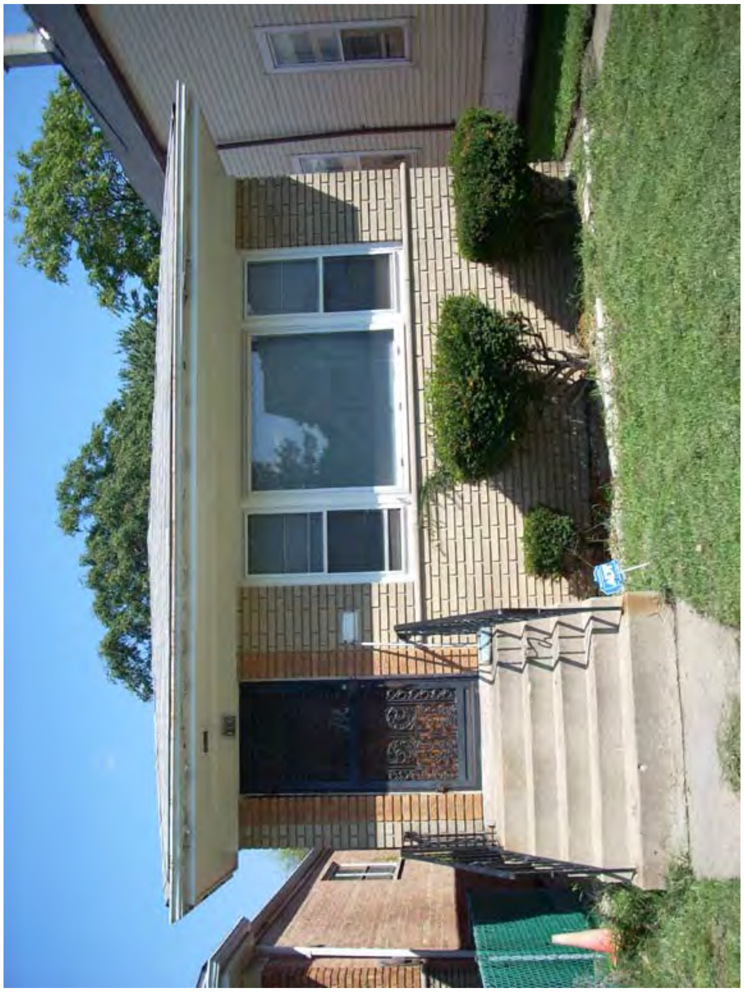
South façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story house in the Roseland community is situated on a raised basement, has a front gable roof covered with asphalt shingles, and a front overhang. Its front elevation is clad in buff brick below the sill line and orange brick above. It has an off-center door with concrete steps and metal railings and a picture window flanked by one-over-one windows. This building does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

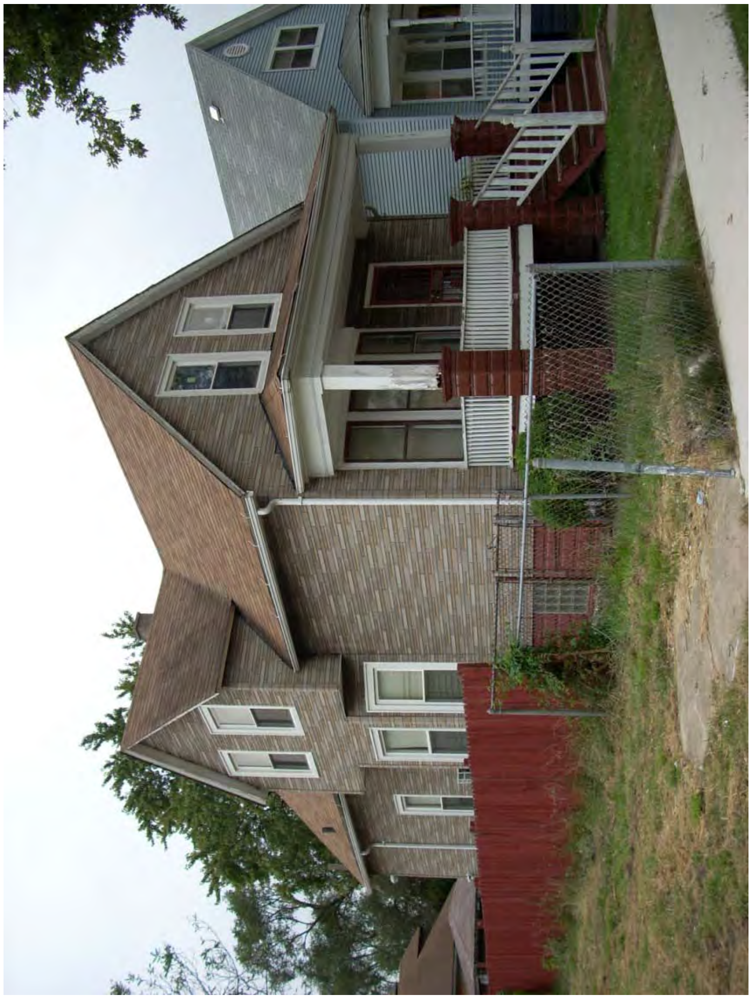
North and east façades of 1.5-story, frame, single-family residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is clad with synthetic siding. The building has a gable roof covered with asphalt shingles. The front elevation has a hip-roof, full-width porch with faux stone piers topped by squat squared wood column supports, wood steps and straight wood railings. It also has an off-center entrance with a metal storm door, a strip of three windows on the first floor, and two windows on the second. Windows throughout the house are non-original one-over-one aluminum-sash. The east elevation has a three-sided bay window on the first floor with a gable wall dormer above. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

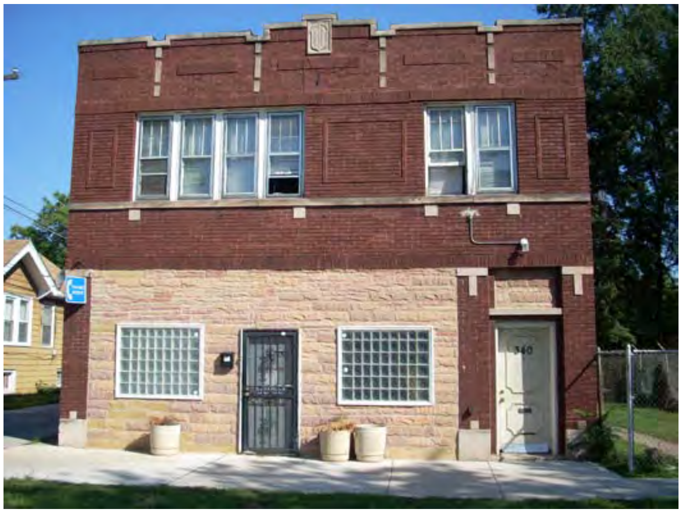
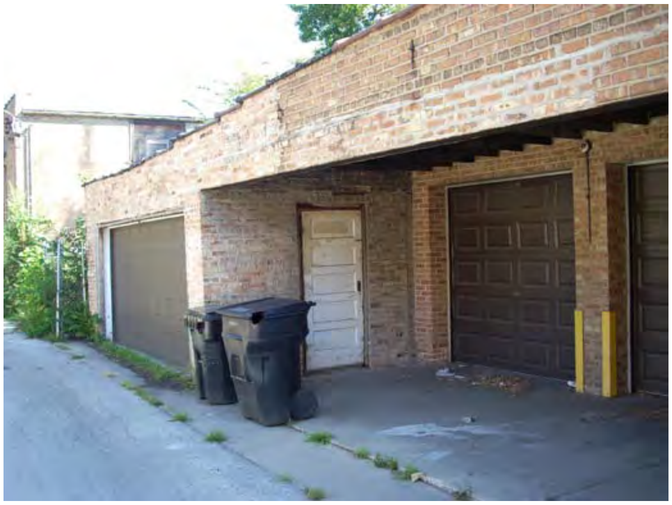
South façade of a brick, two-story, multi-family residence (above), outbuilding (garage) below.





Property Description: **Stories:** 2

This two-story residential building in the Roseland community has a flat roof and crenellated parapet with concrete coping. Its front elevation is clad in brown face brick and its side elevations are clad in common brick. The front elevation features two hollow core metal doors, the outline of a former storefront that has been in-filled with faux stone and two glass block windows, and six three-over-one wood-sash windows on the second floor. The original off-center entrance that provides access to the second floor apartment has a transom that is in-filled with faux stone. Detailing includes a concrete sill course, inset brick panels, and a parapet that features small decorative concrete insert blocks and a centrally located stone panel with shield. This building lacks integrity and does not have sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised concrete block basement, is clad in synthetic siding, and has a side gable roof covered with asphalt shingles. The peaks of the side gables are clad in wood board-and-batten. The front façade of the home has a projecting gabled entrance vestibule with a small casement window, concrete steps with metal railings, and a larger window opening that is partially obscured by a low metal awning. Non-original double-hung windows are used elsewhere. Scalloped verge boards frame the projecting gable. A rear, dormer addition is visible from the street. This building lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

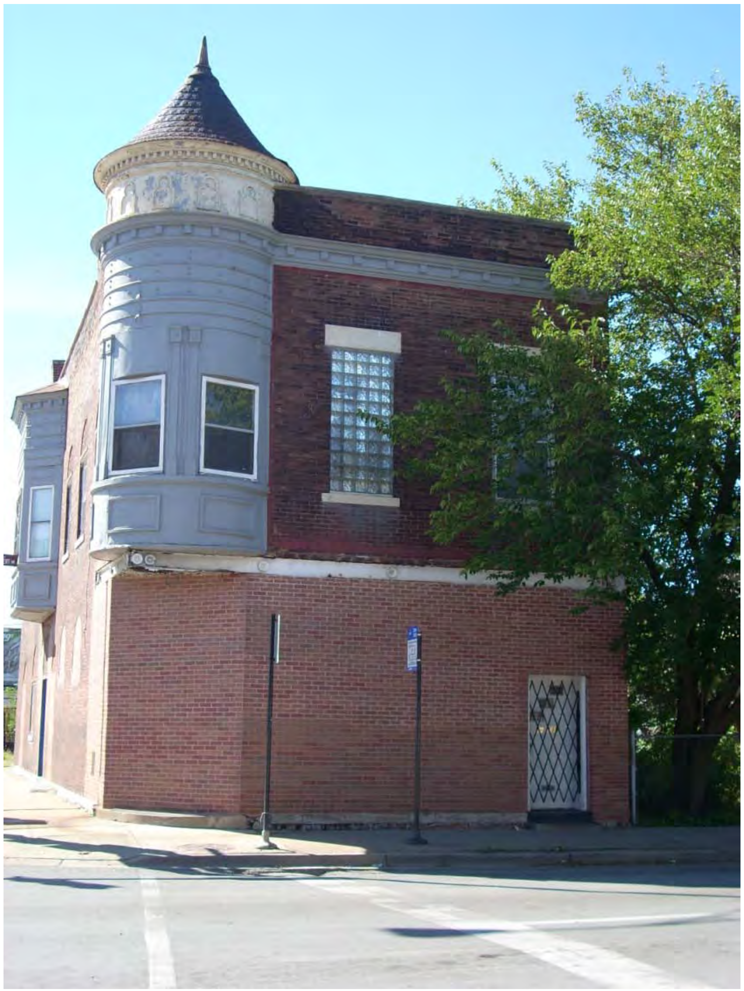
North façade of a brick, two-story, mixed-use building.



Property Description: **Stories:** 2

This two-story Queen Anne style commercial building at the southwest corner of 115th and State streets in the West Pullman community is clad with brick and has a flat roof and parapet. The first floor of both street elevations has been drastically altered by the removal of the corner storefront and the infill of virtually all door, window, and round-arch transom openings with brick. The first floor of the front (115th Street) elevation currently features a single, non-original, off-center hollow core metal door. The first floor of the State Street elevation has a centrally-located non-original hollow core metal door and a single non-original one-over-one aluminum-sash window. The second floor, however, retains its original metal corner turret with conical roof and a three-sided metal window bay on the State Street elevation. Both bays have rectangular panels at their bases and dentil molding, and the turret features decorative pilasters. However, the windows in both the bay and turret are non-original. The second floor of the 115th street elevation has a non-original glass block window and an aluminum-sash window, both of which have stone sills and lintels. The second floor of the State Street elevation has a series of non-original one-over-one aluminum-sash windows with rounded transoms that have been in-filled with brick. This building lacks integrity and is not individually eligible for listing on the National Register.

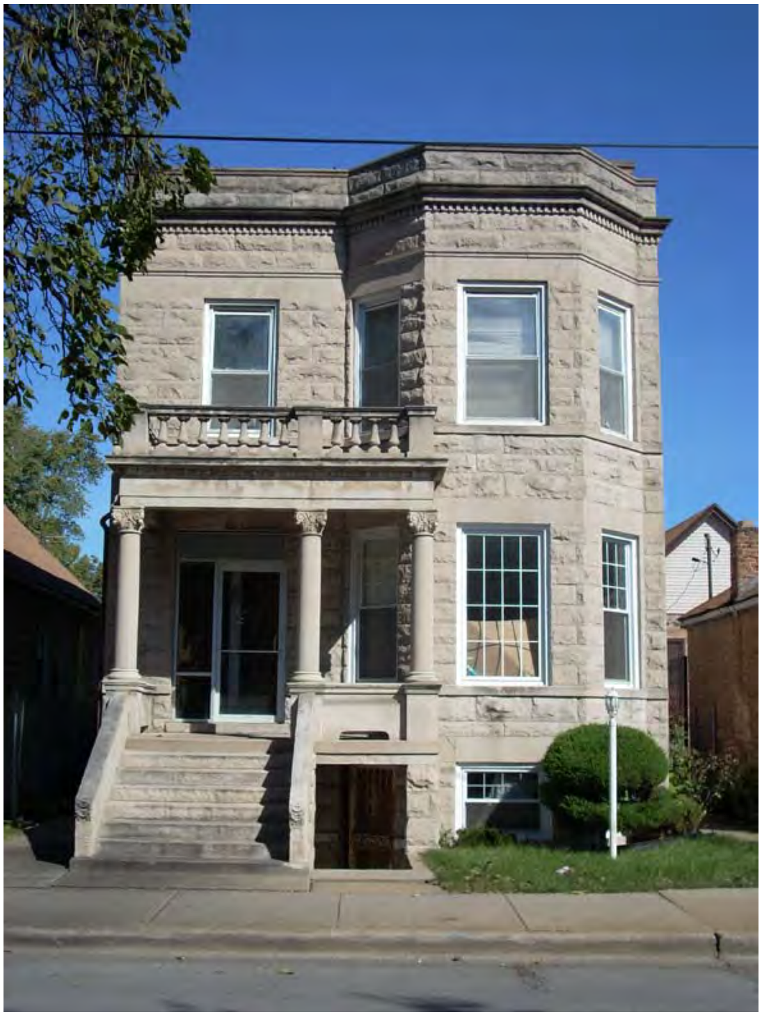
South façade of a greystone, two-flat residence.



Property Description: **Stories:** 2

This two-flat residential building in the Roseland community is situated on a raised basement and is clad with rusticated limestone on its front elevation and common brick along its side and rear elevations. The building has a flat roof and parapet. Its front elevation has a full-height three-sided window bay pavilion, a partial-width stone porch with Corinthian columns and balustrade, and an off-center entrance with metal storm door. There is a secondary entrance to the lower level. The first floor window bay has a non-original central fixed-pane window with multiple lights and flanking nine-over-one windows. The second floor of the front elevation has four non-original one-over-one aluminum-sash windows—three on the bay and one above the entrance. Casement windows provide light to the basement. Detailing includes smooth stone sill courses, belt courses, and a cornice with dentil molding.

This is an example of a greystone, a building type that the City of Chicago has recognized through its Historic Greystone Initiative. However, there are thousands of greystone residential buildings in Chicago and this particular example does not stand out among the city’s stock of this residential building type. As a result, it does not qualify as individually eligible for listing on the National Register.

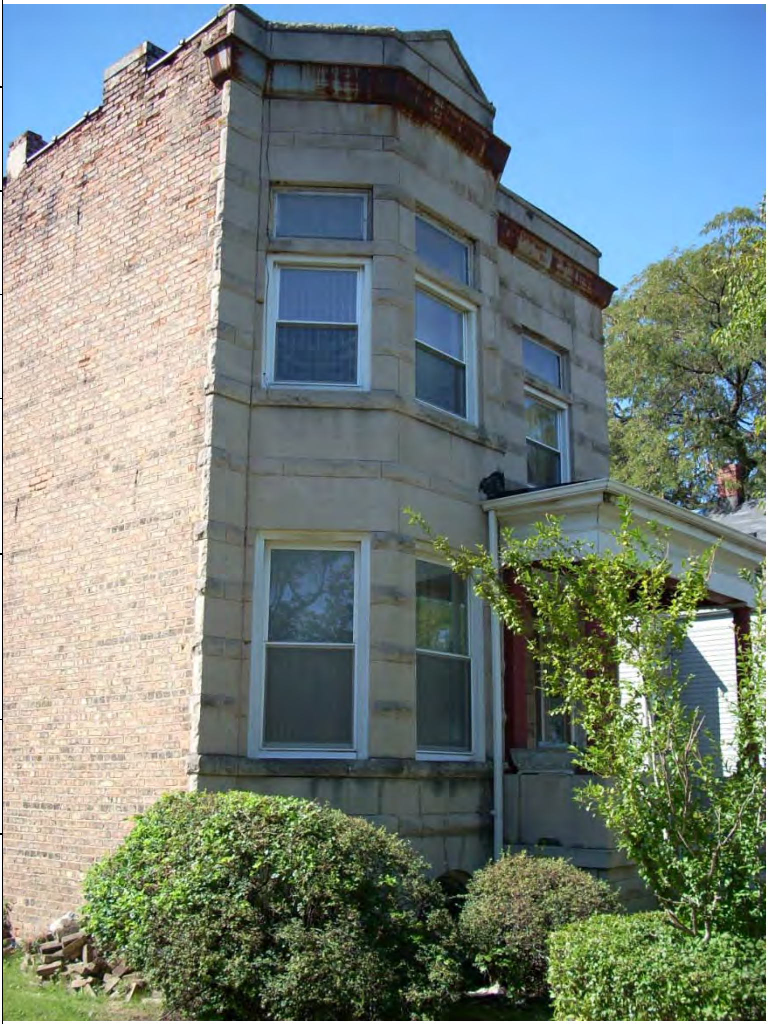
North and east façades of two-flat greystone residence.



Property Description: **Stories:** 2

This two-flat residential building in the West Pullman community is situated on a raised basement and has a front façade clad with limestone; common brick cover both the sides and rear. The building has a full-height three-sided window bay pavilion, flat roof, and a shaped parapet with a pediment above the bay. Its off-center, flat-roofed porch has concrete steps, metal railings, Doric columns, and a non-original metal door with transom. Windows are non-original one-over-one and those on the second floor feature transoms. Detailing includes continuous banding in rusticated limestone and a metal cornice.

This is an example of a greystone, a popular historic residential building type that the City of Chicago has recognized through its Historic Greystone Initiative, which offers technical assistance and financial resources to property owners to encourage their preservation. This building does not possess sufficient distinguishing architectural characteristics to qualify for individual listing on the National Register.

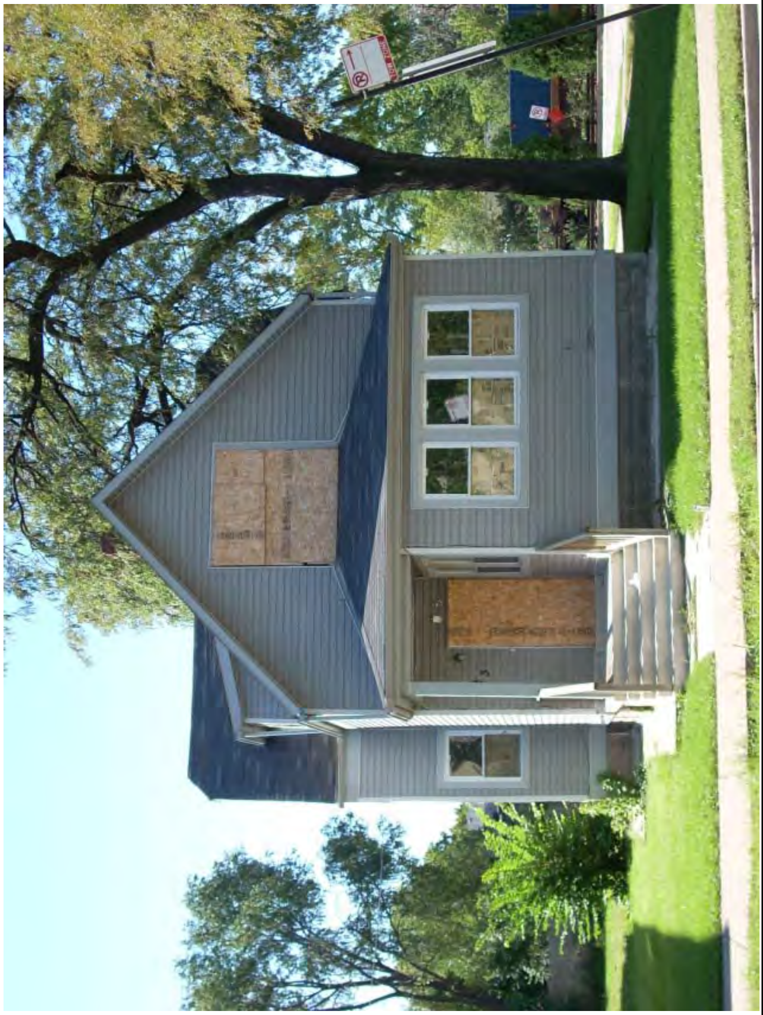
North façade of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the West Pullman community is clad with synthetic siding, has a limestone foundation, and has a gable front roof crossed by hip-on-gable sides. The front elevation has a full-width hip roof porch, a portion of which is enclosed. A shed roof dormer is visible on a side elevation. The open portion of the porch has wood steps and railings, a wood post, and a door opening covered with plywood. Windows are one-over-one aluminum-sash, some of which are covered with plywood. This house does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

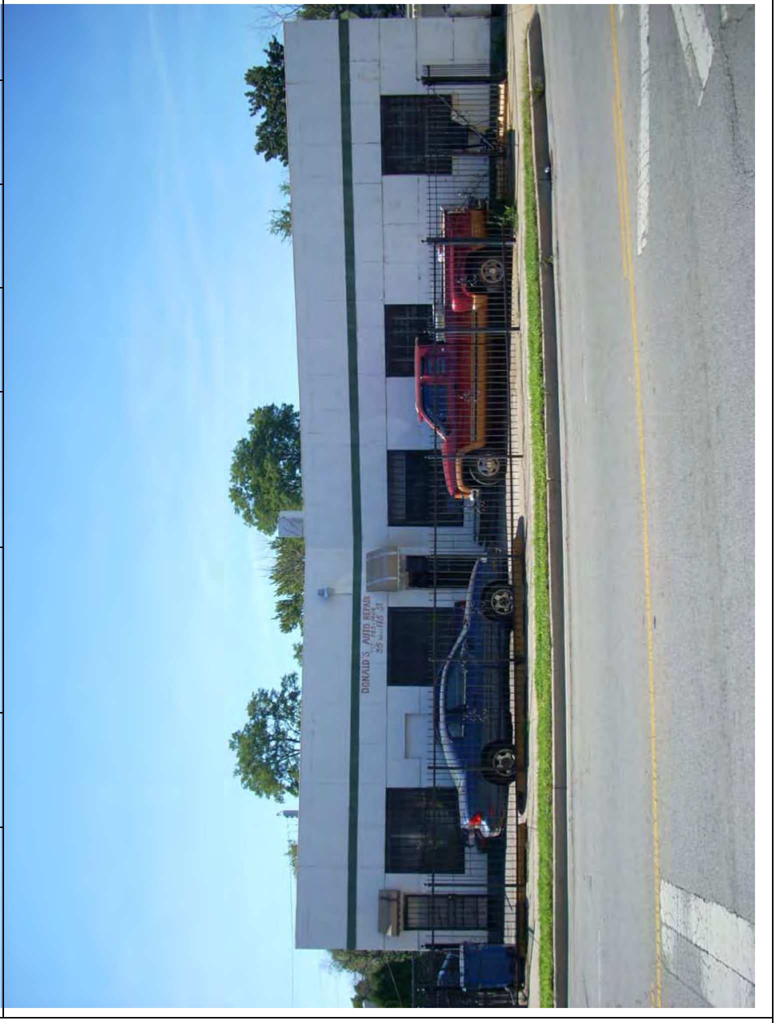
North façade of one-story, sheet metal and brick clad, commercial building.



Property Description: **Stories:** 1

This one-story auto repair building at the corner of 115th Street and Lafayette Avenue in the West Pullman community has a flat roof and a V-shaped footprint. Its street elevations are clad with white sheet metal and its rear elevations are clad in common brick. Overhead metal garage doors are situated on either end of the building while the bent front elevation along 115th Street features two metal doors and a series of fixed-pane steel sash windows. Windows along the rear of the building are covered with corrugated metal. This building does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

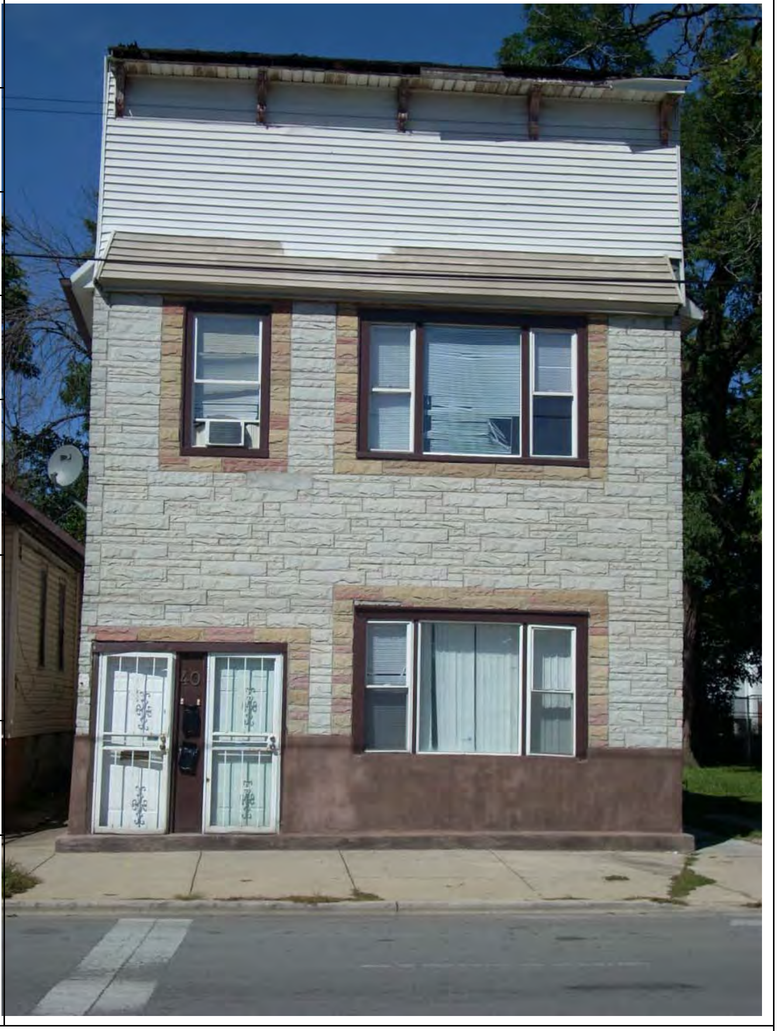
South façade of two-story, multi-family, frame residence (former commercial building).



Property Description: **Stories:** 2

This two-story residential building in the Roseland community has a flat roof and parapet. Its front façade is mostly clad in synthetic faux stone siding with contrasting colors around the doors and windows. The lowest portion of the façade is covered in stucco; the upper portion is clad in synthetic siding. The front elevation has two hollow metal core doors, Chicago-style windows on the first and second floors, and a single one-over-one window on the second floor. A pent roof is situated above the second floor windows and a bracketed wood cornice is situated at the parapet level. This building lacks integrity, does not have sufficient distinguishing architectural features, and is not individually eligible for listing on the National Register.

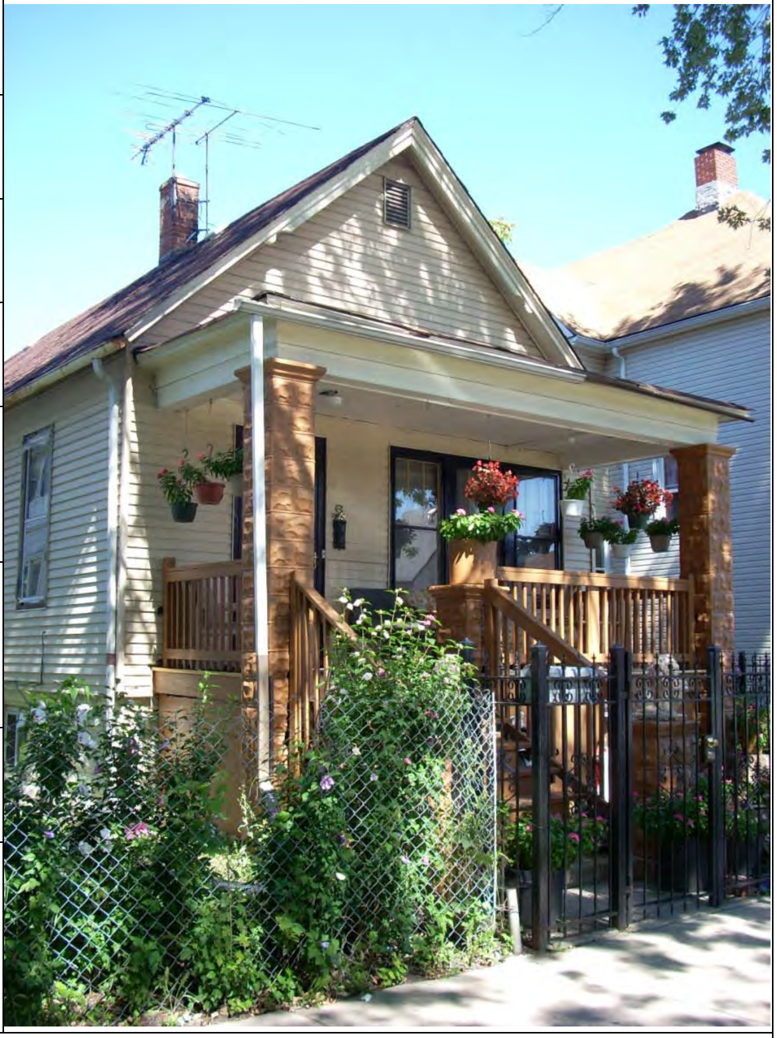
North façade of one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story house in the West Pullman community is situated on a raised concrete block basement, is clad with synthetic siding, and has a gable roof covered with asphalt shingles. Its front elevation features a full-width, hip roof, wood porch with faux stone pier supports and replacement wood railing. The front also has an off-center front door and a strip of three one-over-one windows. This house lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

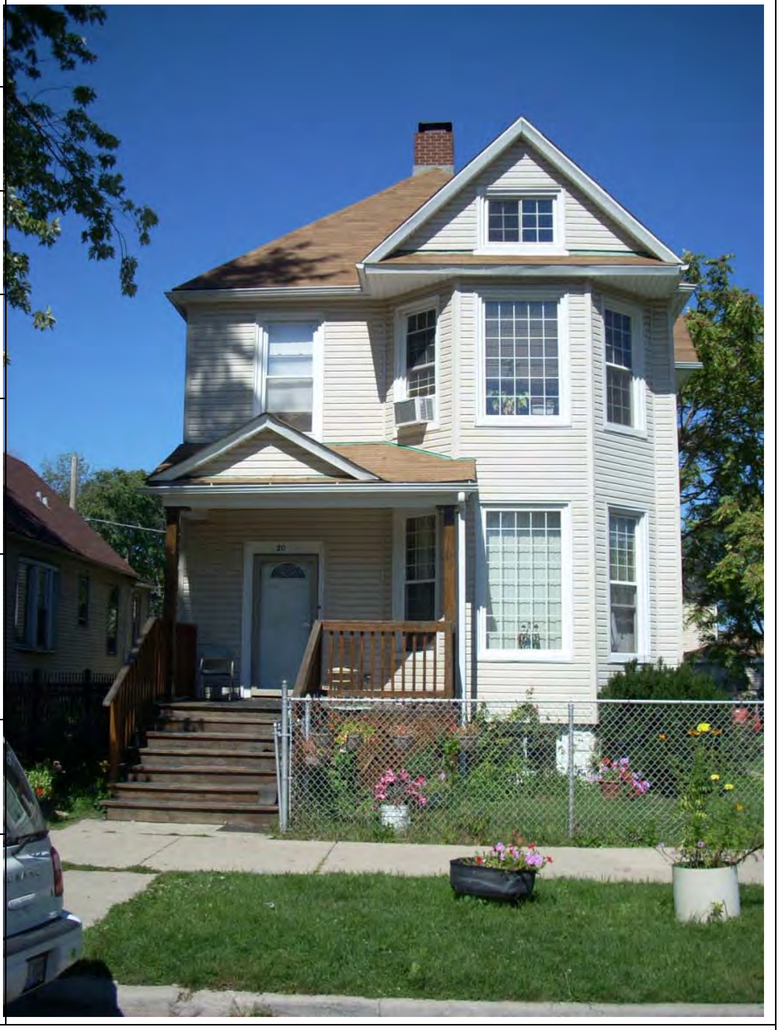
North façade of two-story, single-family, frame residence.



Property Description: **Stories:** 2

This two-story Queen Anne style house in the West Pullman community is situated on a raised concrete block basement, is clad with synthetic siding, has full-height window bay pavilions with pediment and gable dormers on its front elevation and side elevations, and has a hip roof covered with asphalt shingles. The front elevation has a shed-roofed partial-width wood porch with pediment and metal hollow core paneled door. Fenestration is non-original on the front elevation bays and features fixed-pane windows with multiple lights, multi-paned double-hung windows, and a single one-over-one window on the second floor, directly above the porch. This house lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

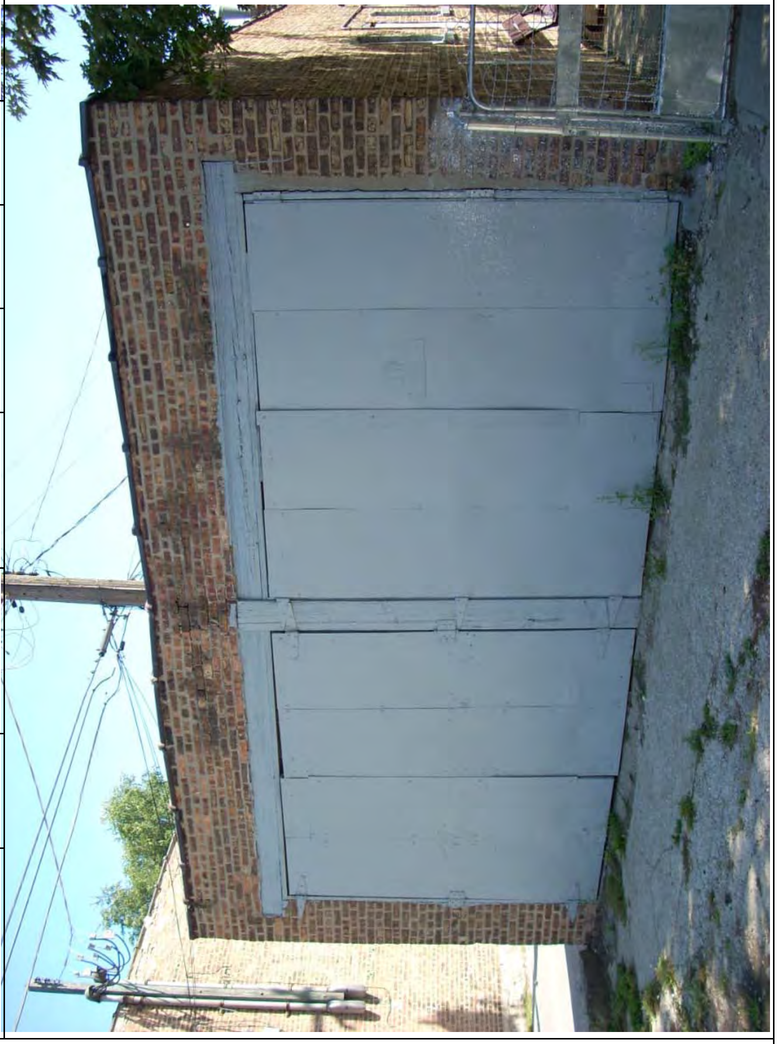
North façade of one-story brick garage.



Property Description: **Stories:** 1

This one-story, four-car garage building in the West Pullman community is clad in common brick and features two pairs of hinged metal garage doors with a continuous wooden lintel along its front elevation. A side (alley) elevation displays the outlines of dormer door openings that have been in-filled with brick as well as a hinged metal garage door. This building does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

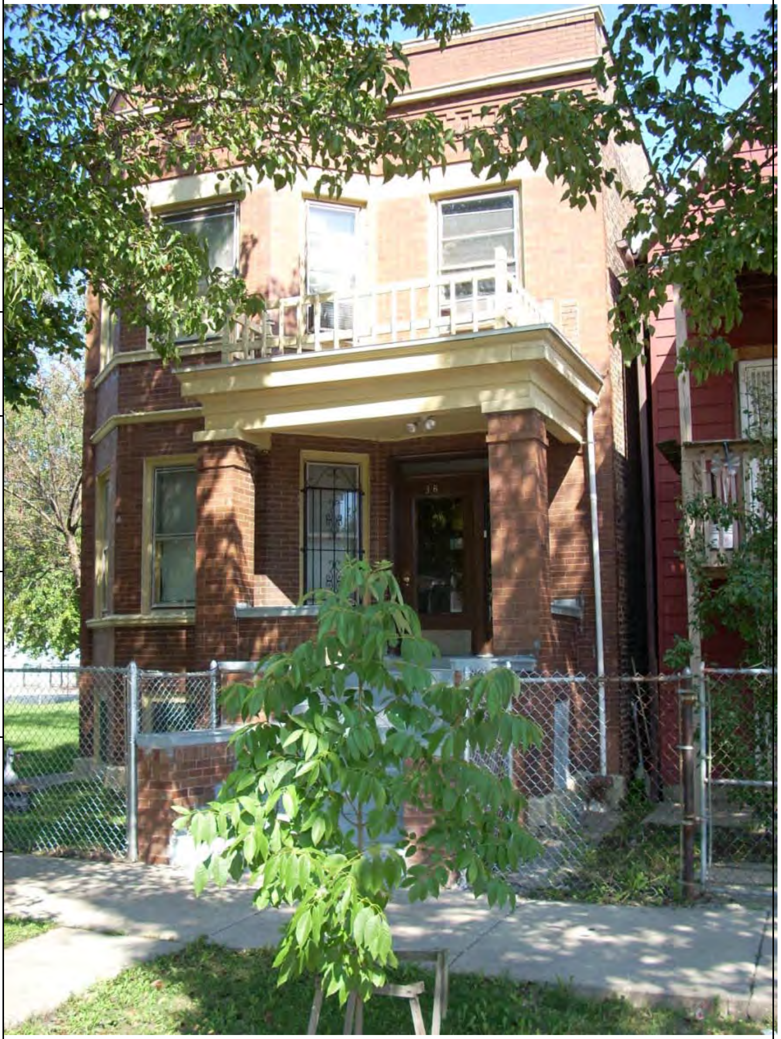
East façade of brick, two-flat residence.



Property Description:

Stories: 2

This two-flat residential building in the West Pullman community is situated on a raised basement and has a front façade clad with orange face brick. It has a full-height three-sided window bay pavilion, flat roof, and parapet. Its off-center flat-roofed porch has concrete steps, brick piers, and a single-light oak door with sidelight. Fenestration is comprised of one-over-one windows. Detailing includes stone sill courses, beltcourse, a cornice, as well as decorative brickwork on the parapet. This building does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This two-story frame residential building in the West Pullman community is situated on a raised concrete block basement and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. Both floors of the front elevation are partially obscured by a full-width wood porch with exterior steps leading to a second floor balcony. Both floors also have a hollow core metal door and non-original double-hung windows: three on the first floor and two on the second. A third window on the second floor has been in-filled. There is a single-pane window in the gable. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

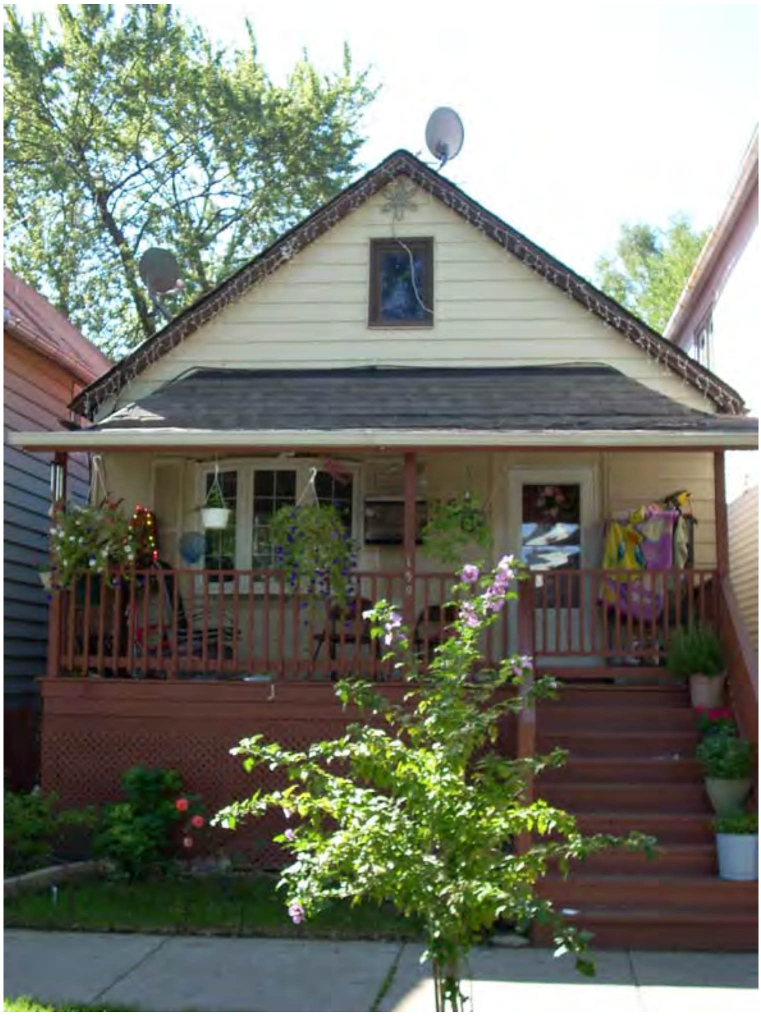
North façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story house in the West Pullman community is situated on a raised concrete block basement, is clad with synthetic siding, and has a gable roof covered with asphalt shingles. Its front elevation features a partial-width porch with concrete steps, metal railings, and open metal posts supporting a metal canopy roof. It has a centrally located door and four non-original one-over-one windows: three on the first floor and one in the gable. This house lacks integrity, does not have distinguishing architectural features, and is not individually eligible for listing on the National Register.

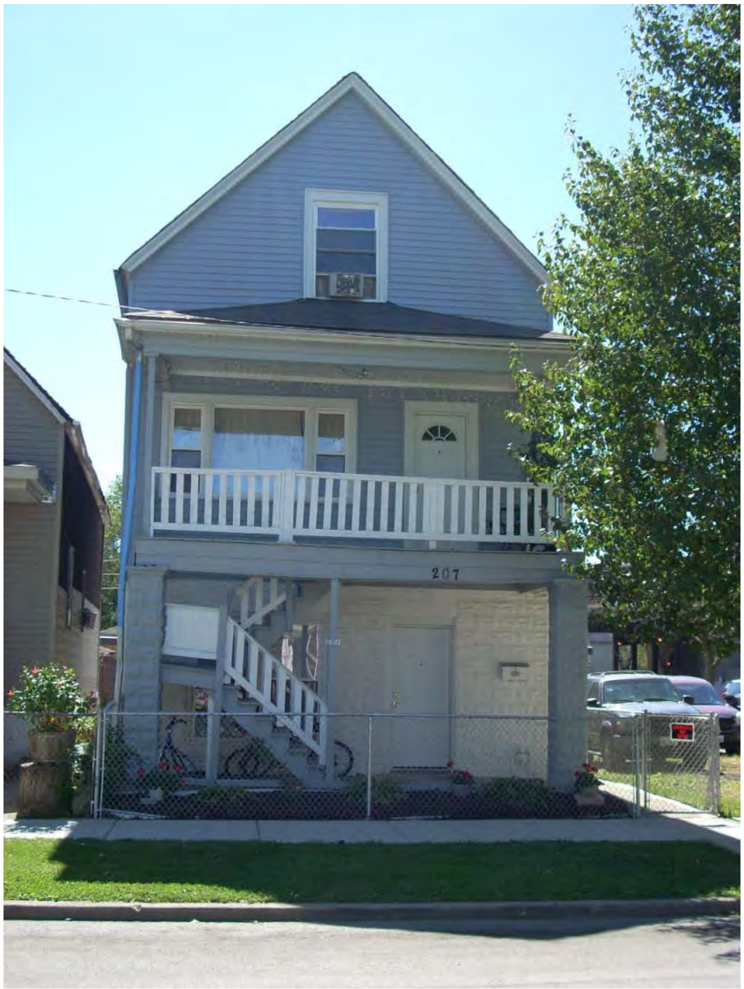
North façade of a 2.5-story, multi-family, frame residence.



Property Description: **Stories:** 2.5

This two-and-a-half-story frame house in the West Pullman community is clad in rusticated concrete bock on the first floor and in synthetic siding above. The building has a front gable roof with asphalt shingles. It has a two-story full-width, hip-roof wood porch/balcony with faux stone piers and wood posts as supports on the first and second floors, respectively. A non-original stairway leads to the second floor balcony. Both first and second floors have off-center non-original hollow core metal doors. Windows on the front elevation are non-original and include one on the first floor that is obscured by the staircase, a picture window flanked by one-over-one aluminum-sash windows on the second floor, and a single one-over-one aluminum-sash window in the gable. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This two-story frame house in the West Pullman community is situated on a raised concrete block basement with glass block windows, is clad with synthetic siding, and has a gable roof with asphalt shingles. The fenestration pattern has been altered with the moving of the main entrance from the 118th Street elevation and the windows, which feature non-original casements and one-over-one non-original aluminum varieties on both the first and second floors. This house lacks integrity, does not have visible distinguishing architectural features, and is not individually eligible for listing on the National Register.

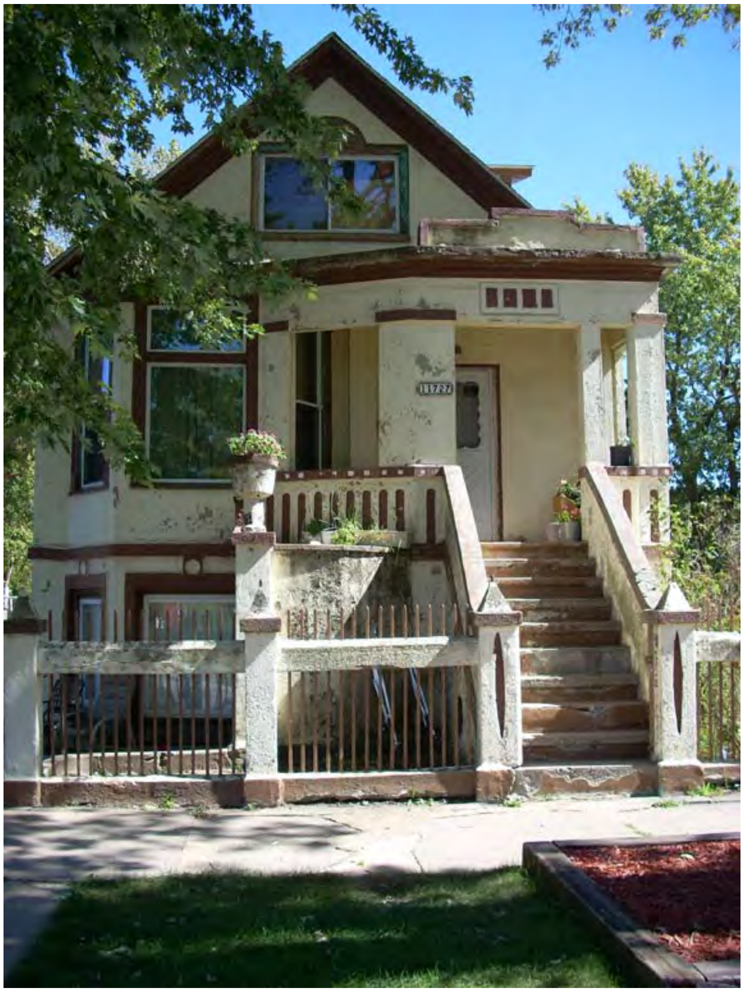
West façade of a one-story, single family, stucco residence.



Property Description: **Stories:** 1

This one-story frame cottage in the West Pullman community is situated on a raised basement and is covered with stucco. The building has a front gable roof covered with asphalt shingles and a gable dormer along its south elevation. It has a partial-width flat-roofed porch that appears to be concrete, with solid sidewalls, straight posts, and a stepped parapet. Its front elevation has an off-center non-original hollow core metal door and a three-sided window bay with single-pane window and transom in the center flanked by one-over-one aluminum-sash windows. There is a pair of sliding aluminum-sash windows in the gable with a lunette fixed-pane window above. Windows are modern replacements. While the stucco cladding is somewhat unusual for this community's housing stock, this particular house lacks integrity as well as architectural features that are distinctive enough to merit individual inclusion on the National Register.

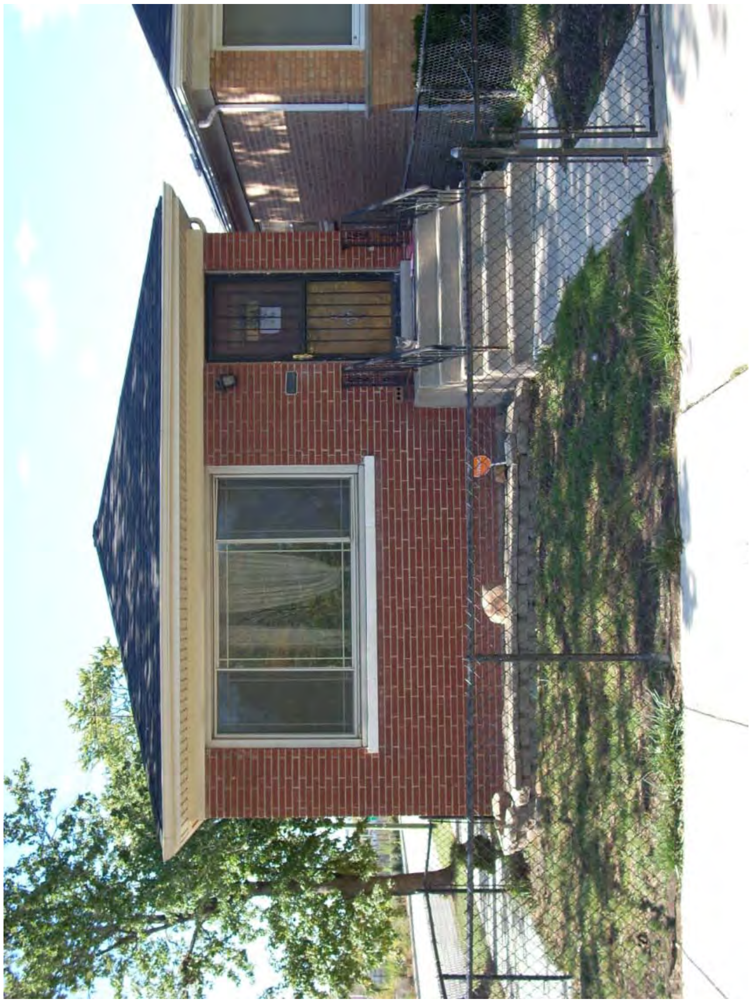
East façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story house at the northwest corner of Eggleston Avenue and Fernwood Parkway in the Washington Heights community is situated on a raised basement and is clad with red face brick on its two street elevations. The building has a hip roof covered with asphalt shingles and overhanging eaves. The front (Eggleston) elevation has an off-center metal storm door, concrete steps with metal railings, and a picture window flanked by casements. The Fernwood Parkway elevation has both casements and glass block windows. It lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

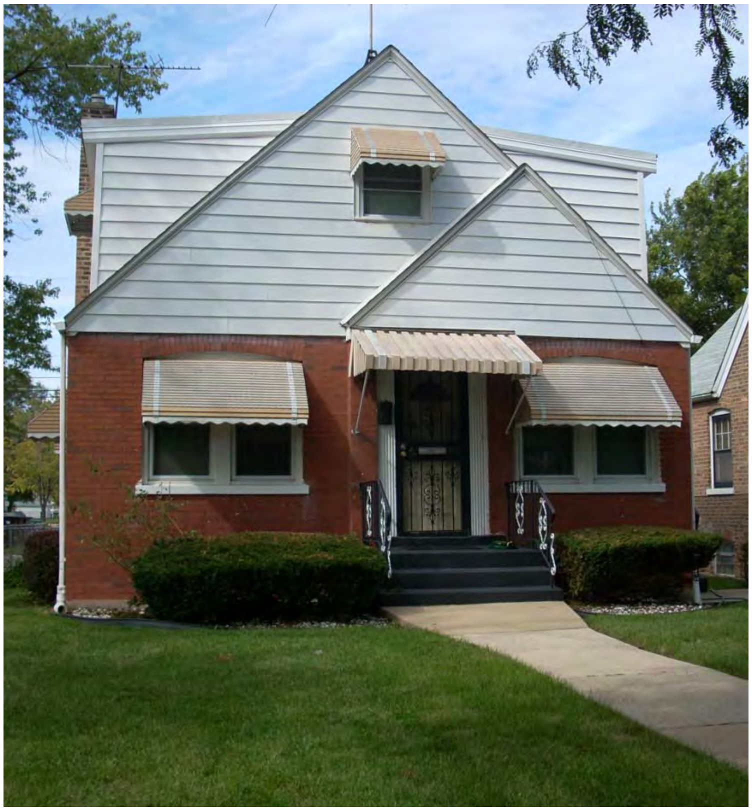
East façade of a two-story, brick and frame, single family residence.



Property Description: **Stories:** 2

This two-story cottage in the Washington Heights community has a gable roof covered with asphalt shingles and large, non-original, flat-roofed, aluminum-clad dormers on both side elevations transforming the original one-story building into a two-story residence. The front elevation is clad with orange face brick, the gables are clad with aluminum siding, and the lower side elevations are clad with common brick. The front elevation has a centrally located hollow core metal paneled door with fanlight, three concrete steps with metal railings, two pairs of windows on the first floor and a single window in the gable. Windows are non-original one-over-one aluminum sash. The front door and windows are sheltered by metal awnings. Detailing includes concrete sills and brick lintel arches. This house does not feature distinguishing architectural elements or sufficient integrity to be individually eligible for listing on the National Register.

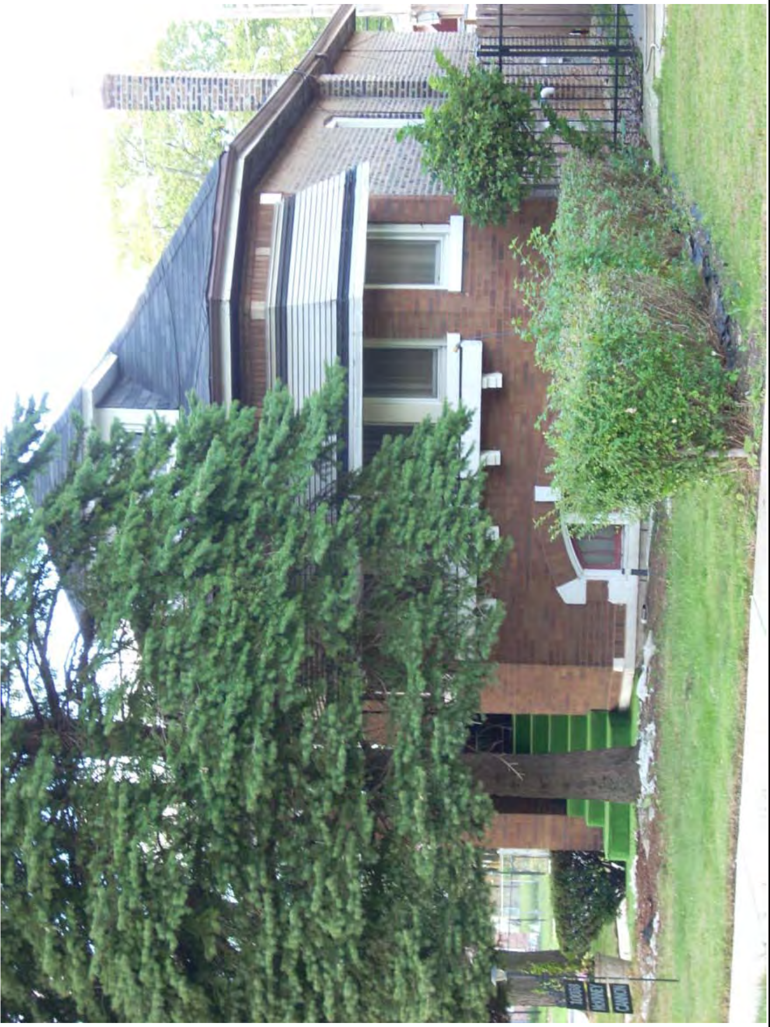
East façade of one-story, brick, single-family residence.



Property Description: **Stories:** 1

This one-story bungalow at the northwest corner of Eggleston and 101st Street in the Washington Heights community is situated on a raised basement and is clad with brown face brick along its two street elevations. It has a hip roof covered with asphalt shingles and hip dormers along both its front and rear elevations. Its front elevation has a curved window group in the basement level with frosted glass casement windows. It has a recessed corner porch with carpeted concrete steps and corner brick pier support, a metal storm door, and a projecting living room bay with one-over-one windows that are partially obscured by a low metal awning. Detailing includes stone block inserts and a planter box. Its 101st Street elevation has glass block basement windows and one-over-one windows on the first floor. This house does not have sufficient distinguishing features to qualify as individually eligible for listing on the National Register.

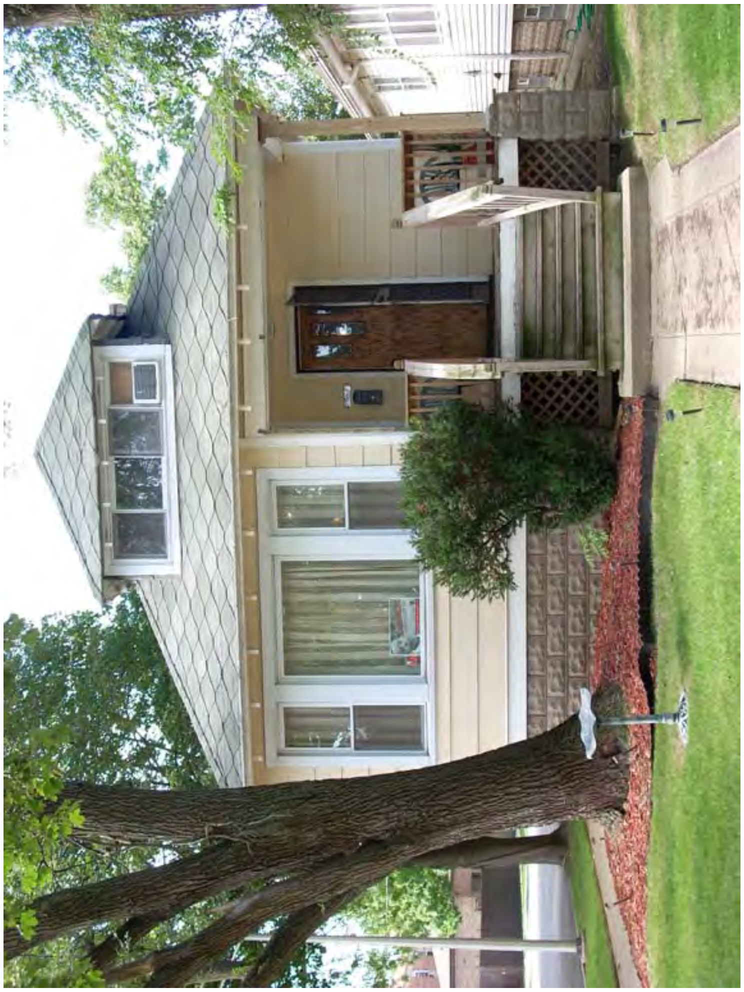
East faced of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman bungalow at the northwest corner of Eggleston Avenue and 106th Street in the Roseland community is situated on a raised concrete block basement with glass block windows and is clad with synthetic siding. The building has a hip roof covered with asphalt shingles, overhanging eaves, decorative rafters, and a hip dormer. The residence has a recessed corner porch with a wood door, wood steps and railings, and a corner support consisting of a faux stone pedestal topped by a Doric column. The front (Eggleston) elevation has a picture window flanked by one-over-one aluminum-sash windows (non-original). The hip dormer has sliding windows, one of which is partially enclosed by plywood. The 106th Street elevation has a gabled pavilion, non-original one-over-one aluminum-sash windows, and a single casement window. This building does not have sufficient distinguishing architectural features or integrity to qualify as individually eligible for listing on the National Register.

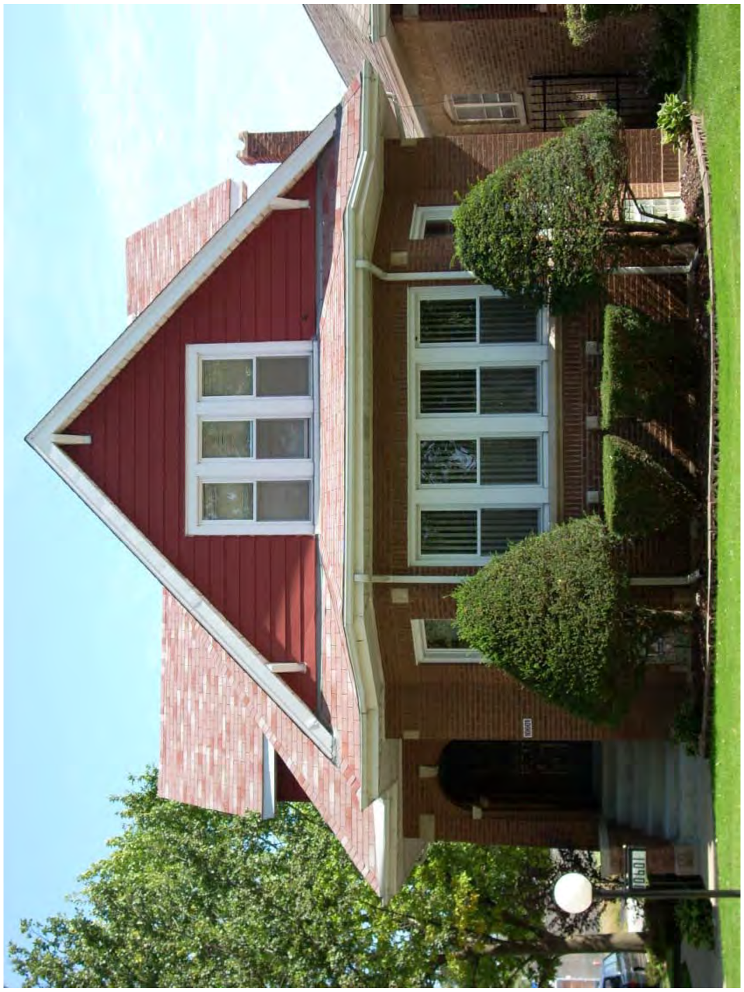
West façade of a one-story, brick, single family residence.



Property Description: **Stories:** 1

This one-story bungalow in the Roseland community is situated on a raised basement with glass block windows. The building is clad in brown brick, has a hip roof covered with asphalt shingles, and has overhanging eaves. The front and both side elevations feature large gable dormers and the rear elevation has a shed dormer, all of which are clad with aluminum siding. The house features a recessed corner porch with a metal storm door, concrete steps, low brick sidewalls, a brick corner pier, and arched front and side openings. The front elevation’s three-sided living room bay has six windows and the front gable dormer has three windows, all of which are non-original one-over-one aluminum-sash. Detailing includes brick soldier courses above and below the living room bay windows, decorative stone insert blocks, and concrete sills. This house does not feature distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story house in the Roseland community area is clad with tan face brick on its front elevation and common brick on its side elevations. The building has a steeply-pitched side-gable roof covered with asphalt shingles and two synthetic-clad gable dormers with one-over-one windows. Its front elevation has a centrally located, gabled, brick-clad entrance vestibule, a metal storm door with an unadorned wood surround, concrete steps with metal railings, and two nine-over-nine windows. It lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story house in the Roseland community with a raised basement is clad with buff brick on its front elevation and common brick on its side and rear elevations. The building has a front gable roof covered with asphalt shingles and has overhanging eaves. Its front elevation has a projecting three-sided living room bay with a picture window flanked by one-over-one aluminum-sash windows that are sheltered by a metal awning. The residence has an off-center entrance with a metal storm door, concrete steps with metal railings, and an wood-clad gable laid in diagonal patterns. Detailing includes two decorative glass blocks adjacent to the front door and scalloped trim around the gable. It does not feature distinctive architectural elements and is not individually eligible for listing on the National Register.

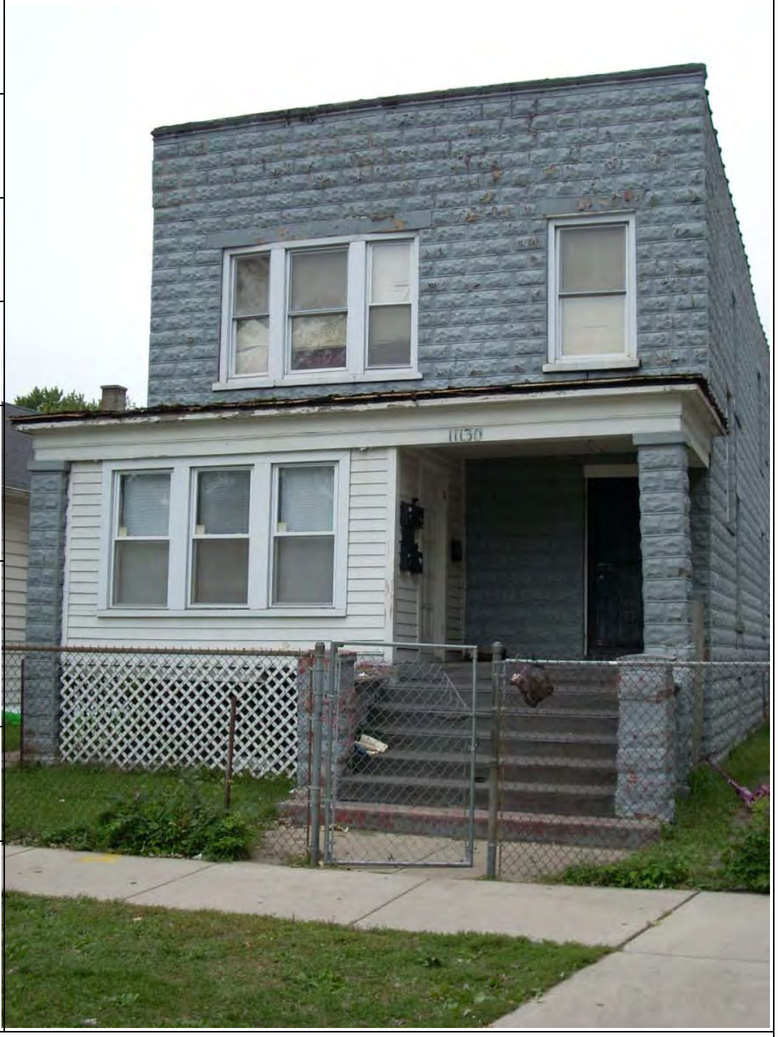
East façade of two-story, concrete block, two-flat residence.



Property Description: **Stories:** 2

This two-flat residential building in the Roseland community is situated on a raised basement and made of rusticated concrete block. The building has a flat roof and parapet. It features a flat-roofed full-width porch, half of which is enclosed and covered with aluminum siding. The enclosed porch has a strip of three non-original one-over-one aluminum-sash windows on its front elevation. The open half of the porch has an entrance with metal storm door, a faux stone corner support, and wood steps flanked by concrete block half-walls. The second floor of the front elevation has a strip of three windows and a single window, which are non-original one-over-one aluminum-sash and have stone sills and lintels. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

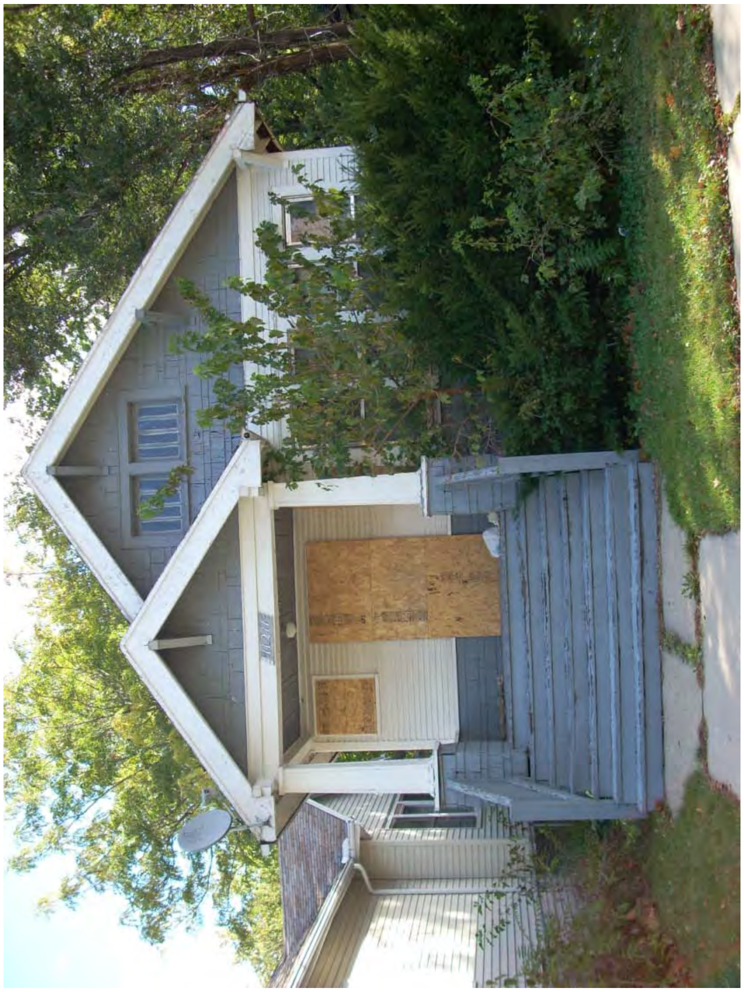
West façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman style bungalow in the Roseland community is situated on a raised brick basement and is clad with wood clapboards with wood shingles in the gabled ends. The building has a front gable roof covered with asphalt shingles and overhanging eaves with exposed rafters and decorative knee braces. The front elevation features a partial-width, front-gable, wood porch with squat, squared Doric columns and a boxed cornice. The porch door and adjacent window opening are covered with plywood. There is a group of four one-over-one windows on the first floor and a pair of original wood casement windows in the attic. This is an example of a Craftsman bungalow, an exceedingly common style during the 1910s and 1920s but lacks distinctive architectural features and is not individually eligible for listing on the National Register.

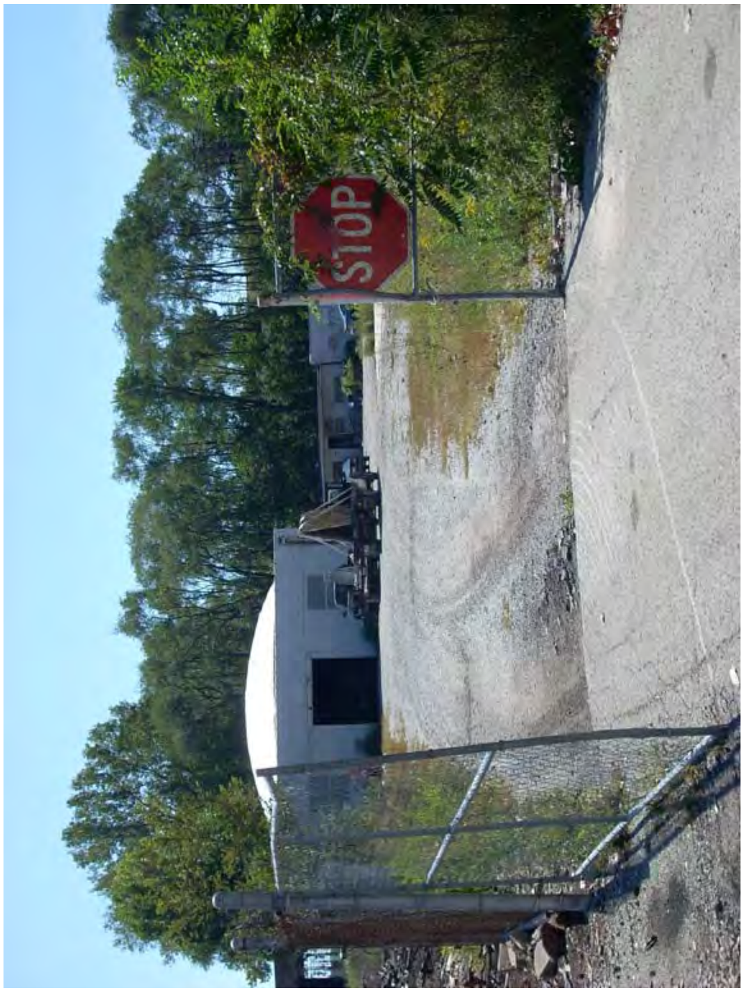
Looking south at light industrial complex.



Property Description: **Stories:** 1

This concrete block, Quonset utility outbuilding in the West Pullman community is set back from the public right-of-way and has a front elevation with a centrally located garage door opening flanked by a one-over-one window on either side. The 1962 aerial photograph shows two buildings on the property, the extant Quonset and a larger building. The larger building was razed between 2007 and 2012. A one-story building and a trailer standing on the remaining concrete slab from the larger, razed building are also part of this complex but too far from the road for evaluation. Windows appear to be fixed-pane on all buildings within the complex. This building complex does not have distinguishing architectural features and is not individually eligible for listing on the National Register.

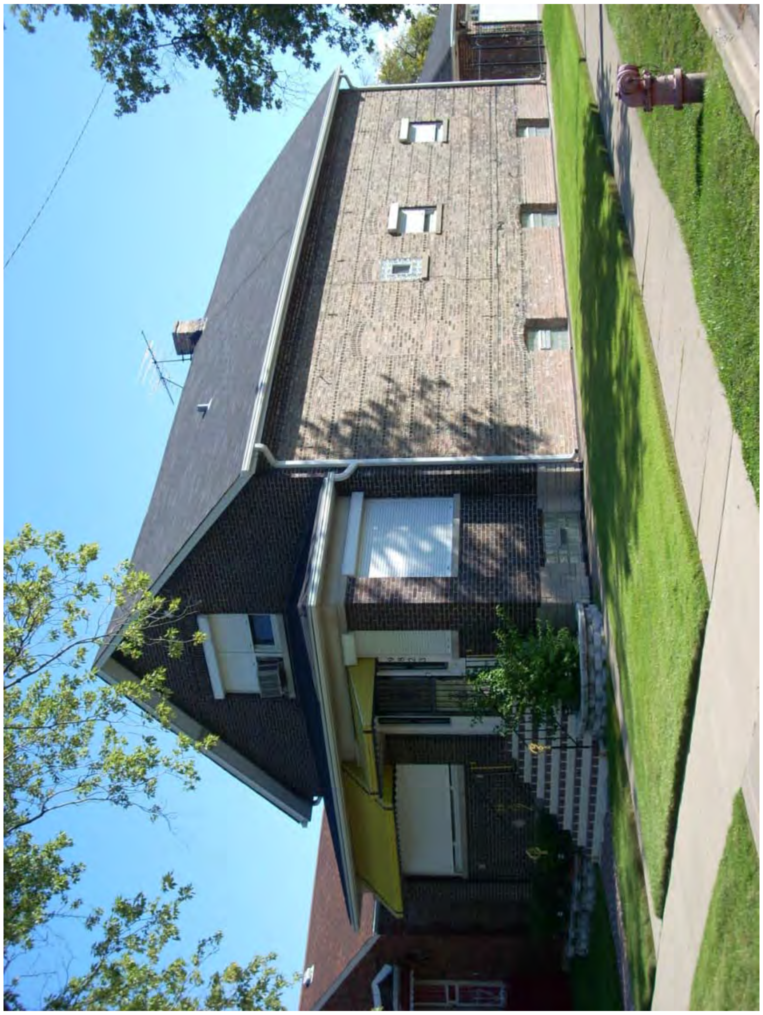
East and north façades, of 1.5-story, single family, brick residence.



Property Description: **Stories:** 1.5

This 1.5-story home in the Roseland community is situated on a raised brick basement with glass block windows and has a front gable roof covered with asphalt shingles. Its front elevation is clad with brown face brick, as is its enclosed, full-width, hip roof porch that has concrete lintels and sills. The front elevation has an off-center door with sidelights, metal steps and railings, and two first-floor window groups that are covered with metal screens, as were the paired windows in the gable. Some windows on the side elevation are in-filled with brick and glass block. This home lacks integrity and does not feature sufficient distinguishing features to qualify as eligible for individual listing on the National Register.

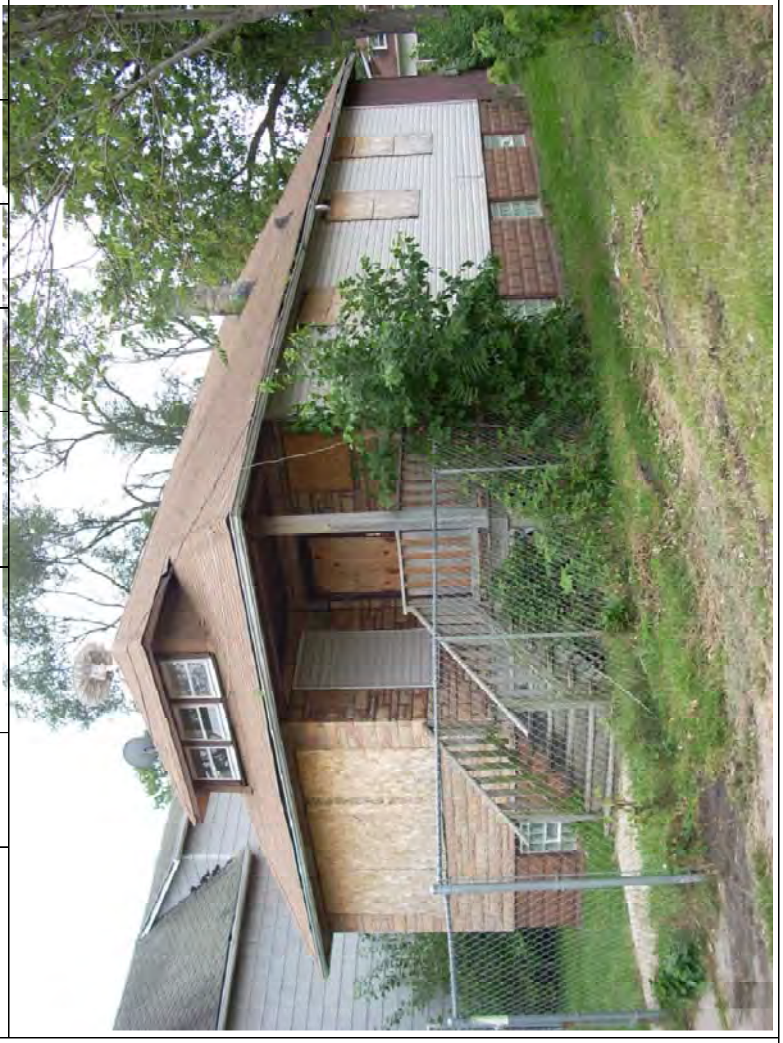
East and north façades of one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story frame bungalow in the Roseland community is situated on a raised concrete block basement with glass block windows and is clad with faux stone on the front elevation. The building has a hip roof covered with asphalt shingles and a hip dormer with three small non-original one-over-one aluminum-sash windows. The front elevation has a recessed corner porch with wood steps, railings, and a corner post. The front door and all first floor windows have been covered with plywood. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

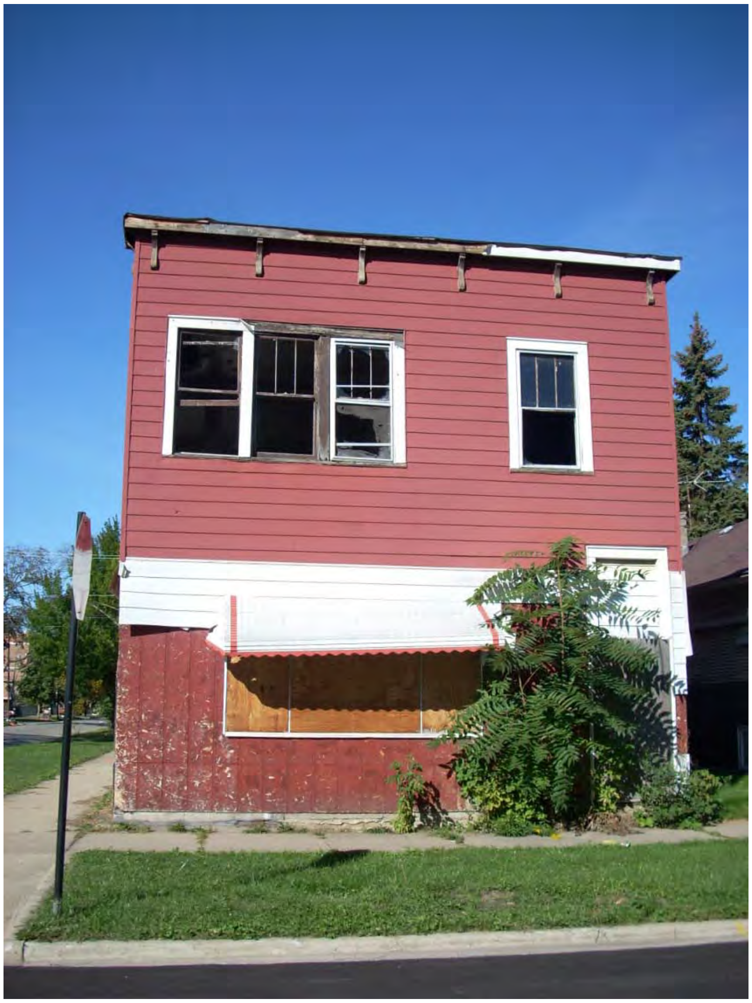
East façade of a two-story, multi-family, frame residence.



Property Description: **Stories:** 2

This two-story building at the northwest corner of Harvard Avenue and 114th Street in the Roseland community is clad with wood board vertically laid on the first floor and with synthetic siding on the second floor. The building has a flat roof and parapet. The front (Harvard Avenue) elevation has an off-center door and a group of three first floor windows that have been covered with plywood and are sheltered by a metal awning. The second floor of the front elevation has four windows—a group of three and a single window—that were formerly three-over-one wood-sash, although most of the glass panes are now gone. The front elevation is topped by a bracketed unadorned wood cornice. The windows on the 114th Street elevation have been covered with plywood on the first floor and have missing glass panes on the second floor. This former commercial building lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

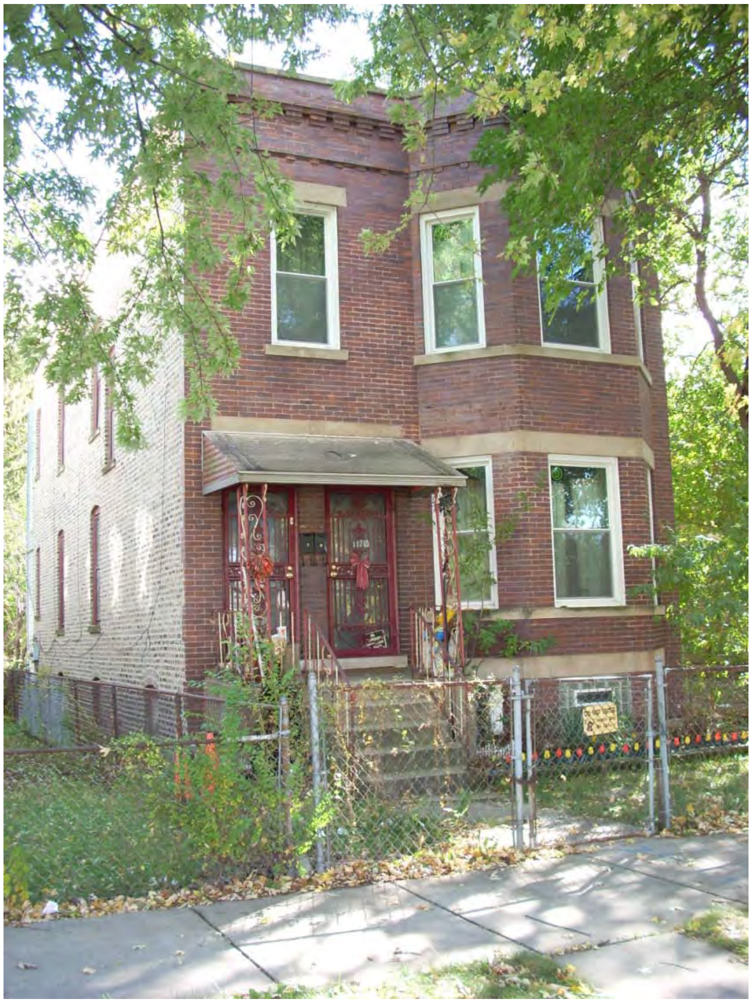
West façade of a brick, two-story, multi-family residence.



Property Description: **Stories:** 2

This two-flat, multi-family residential building in the West Pullman community is situated on a raised basement with glass block windows and is clad with face brick on the front elevation and common brick on the side and rear elevations. The building has a full-height window bay pavilion, a flat roof, and parapet. The front elevation has a partial-width porch with concrete steps and open metal posts supporting a metal shed-roof. A pair of off-center storm doors is located under the porch roof. There are seven non-original one-over-one windows: three on the first floor bay and four on the second floor, including three on its window bay. Detailing includes concrete sills, belt courses, brick cornice with corbelling, and brick dentils. This building lacks distinctive architectural features and is not individually eligible for listing on the National Register.

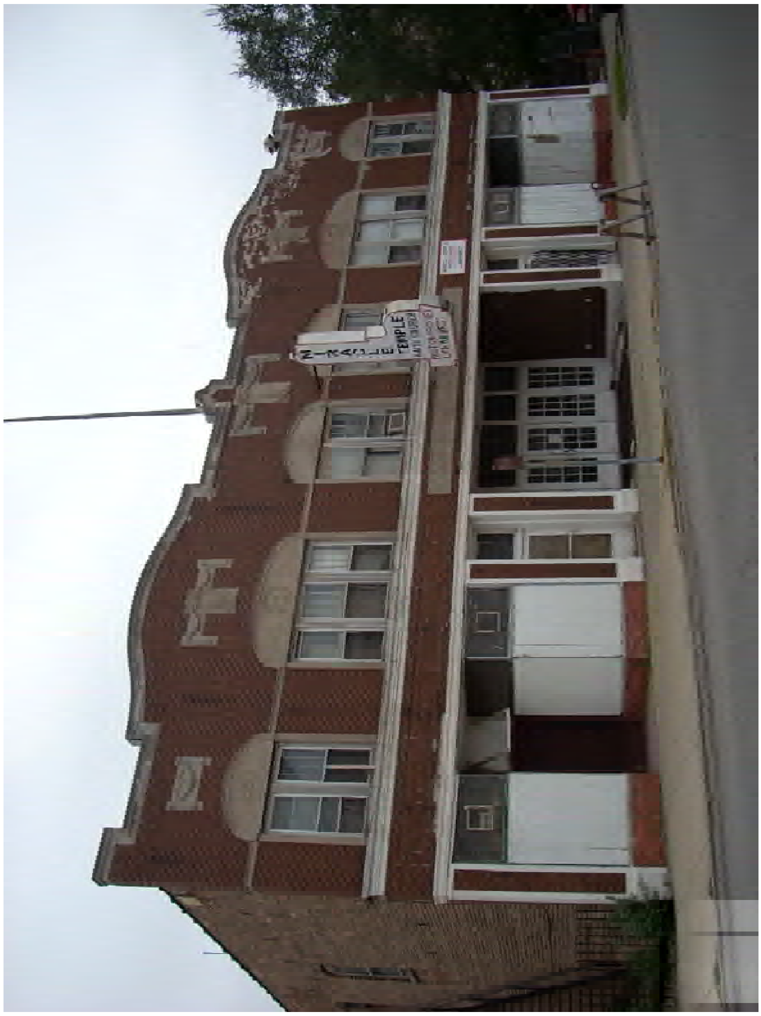
North façade of a brick, two-story, religious building.



Property Description: **Stories:** 2

This two-story building in the West Pullman community (formerly part of Kensington) was originally called “Venetian Hall.” The performance hall was built for a cultural/recreational purpose, although it has long since been repurposed as a church. The 1938 Sanborn shows the hall with a stage, balcony, and place for storage of scenery. The street entrance was flanked by two storefronts in 1938, as it is now.

The building is clad with face brick on its front elevation and common brick on its side and rear elevations. The building has a flat roof and a shaped parapet with concrete coping. The first floor of the front elevation has a recessed centrally located bay with three pairs of multi-light wood doors and in-filled transoms. This central bay is flanked by two original storefronts with central recessed doors and flanking display windows that are covered with wood and topped by transoms that have been in-filled with glass block. Separating the central bay from the two flanking storefronts are two doors with transoms that provide access to the second floor. The spandrel area directly above the central entrance bay has a concrete sign plate with incised lettering that reads: “Venetian Hall.” Fenestration on the second floor features six-over-one and three-over-one wood-sash windows arranged in pairs and in groups of three, topped by round-arch stone lintels with rosette motifs. The parapet features a series of Classical shields and swags.

The exterior of this building has good overall integrity, although elements of the original storefronts materials are no longer extant. However, it does not display sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register for its architecture. Instead, is recommended for individual listing under Criterion A for its original use as a social venue for area residents in the early twentieth century. Local theater houses, such as the Venetian Hall, were jewels within the local communities. It's rare to see an early twentieth century neighborhood social hall that retains its original storefronts and is set within a residential area comprised of worker’s housing, rather than along a commercial thoroughfare. The opening of Illinois Terra Cotta works in the first half of the twentieth century brought Italians to Kensington; the area gradually became a center of South Side Italian-American life with the establishment of Venetian Hall and the nearby San Antonio de Padua (patron saint of Venice) Roman Catholic Church.

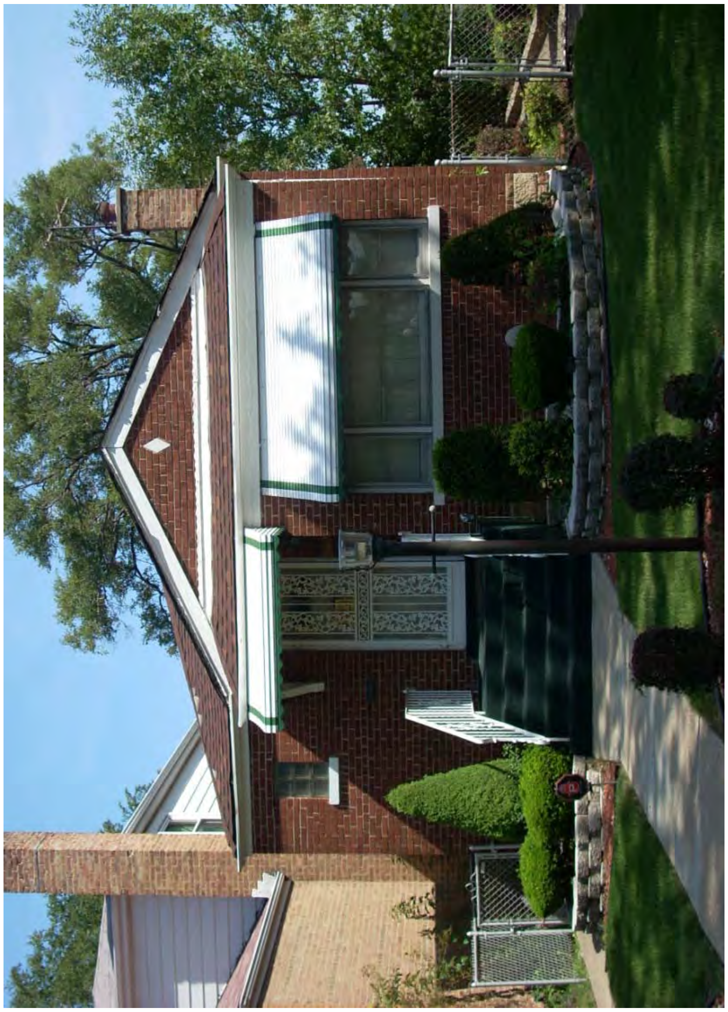
West façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised brick basement with casement windows and has a gable-on-hip roof clad with asphalt shingles. The front elevation has a pent roof, an off-center door, concrete steps with metal railings, a small glass block window, and a picture window flanked by casements. This window group is partially obscured by a low metal awning. Detailing includes a diamond-shaped tile insert in the gable end, stone quoins near the base of the residence, concrete sills, and scalloped boards above and below the pent roof. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

This home in the Roseland community is clad with orange face brick and has a hip roof covered with asphalt shingles. The hip roof extends beyond the front elevation to serve as the roof of the second floor balcony, which is situated above the flat-roofed full-façade porch. Both levels feature open metal supports and railings. The porch has concrete steps. The front elevation features off-center doors trimmed with stone on both floors, a picture window flanked by double-hung windows on the first floor, and a pair of double-hung windows on the second floor. This building does not feature distinguishing architectural features and is not individually eligible for listing on the National Register.

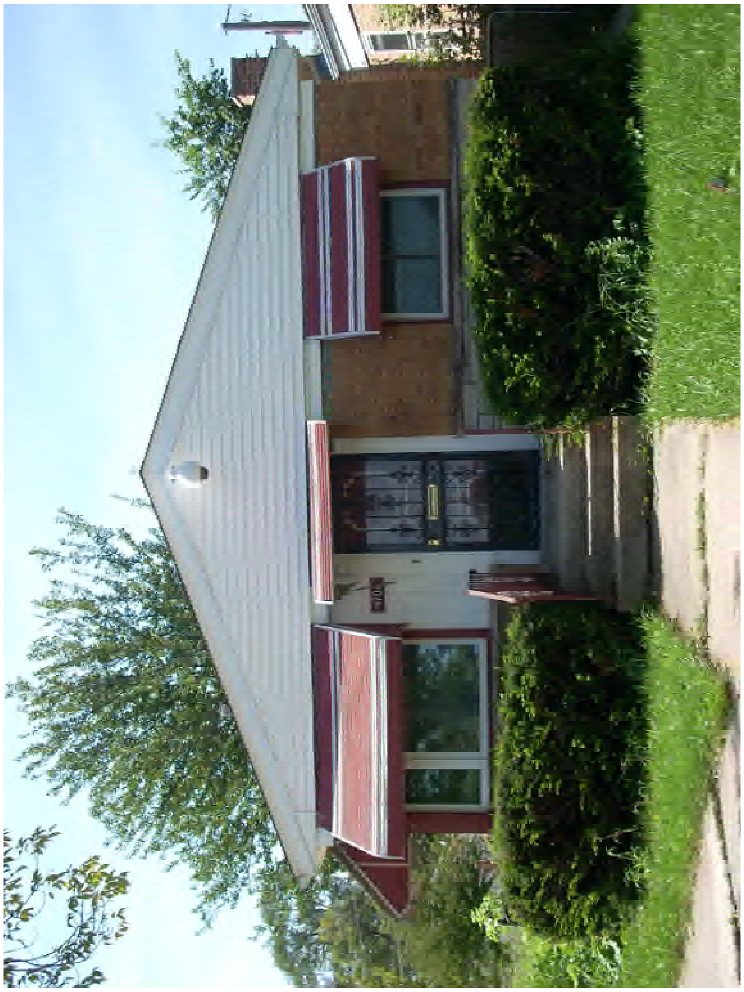
East façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised brick basement and has a front gable roof covered with asphalt shingles. Its front elevation is clad with faux stone below the sill line, orange face brick above, and synthetic siding in the gable. It has a centrally-located door, concrete steps with metal railings, a single-pane window flanked by a casement, and what appears to be a pair of casement windows. Windows are partially obscured by low metal awnings. This standard 1950s era house does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

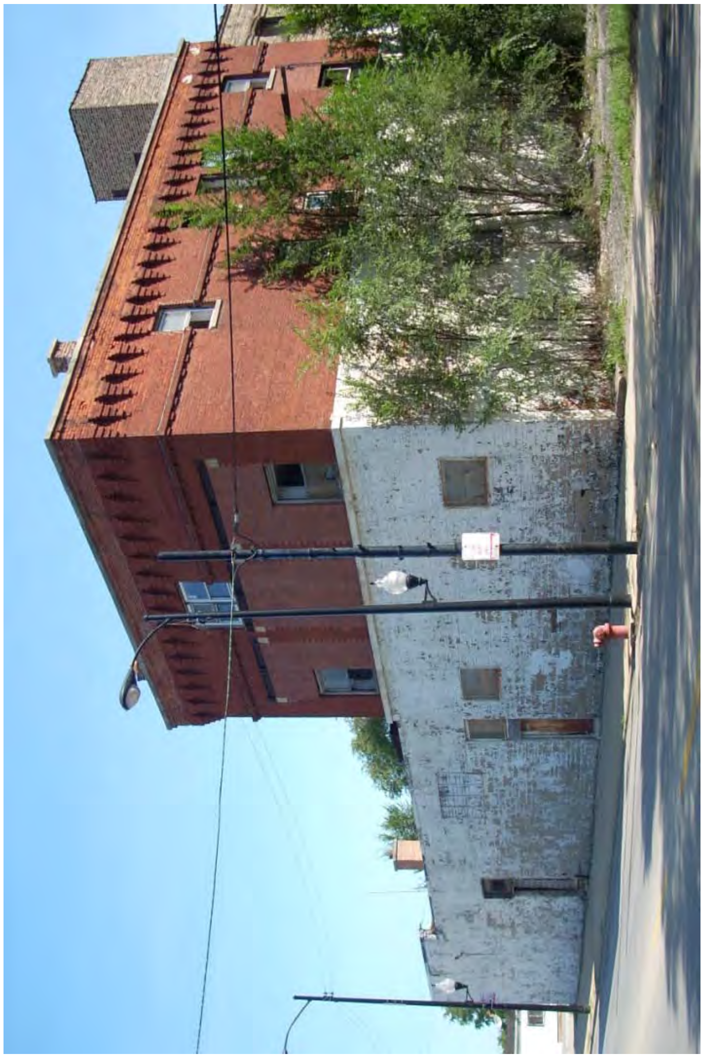
North and east façades of two-story, brick, industrial building.



Property Description: **Stories:** 2

This two-story industrial building in West Pullman has a flat roof and parapet. A one-story, flat-roofed north wing is a later addition (1962). The original building has been drastically altered with new brick cladding on the first floor and the removal of original doors and windows on the front elevation. The first floor of the front elevation currently features two small non-original windows. The original window openings on the second floor of the front elevation have been in-filled with brick. Two one-over-one windows have been installed on either side. Window openings on the side elevations have all been altered as well. The parapet retains original decorative brick corbelling along the front and side elevations. This building does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

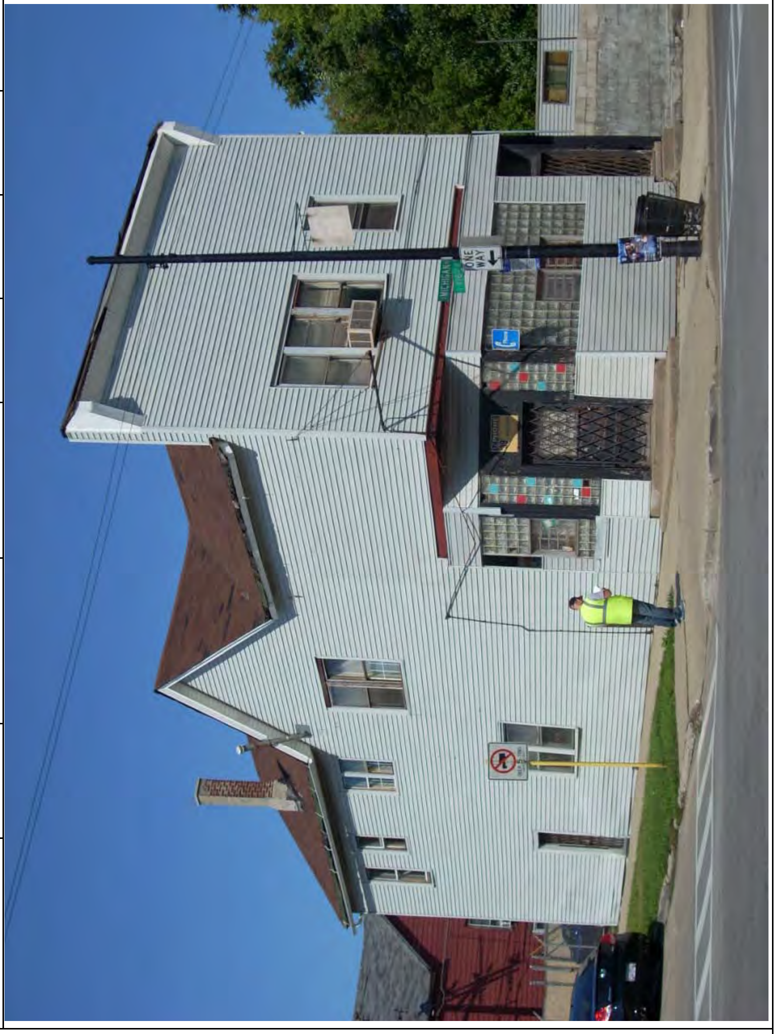
East and south façades of two-story, frame building.



Property Description: **Stories:** 2

This two-story frame building at the northwest corner of Michigan Avenue and 116th Street in the West Pullman community is clad with synthetic siding and has a cross-gable roof covered with asphalt shingles. Its front (Michigan Avenue) elevation features a tall false front, a recessed corner storefront entrance flanked by non-original glass block windows, an off-center metal door with transom that provides access to second floor apartments, and four one-over-one windows. Fenestration along the 116th Street elevation is also comprised of one-over-one windows. This building does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

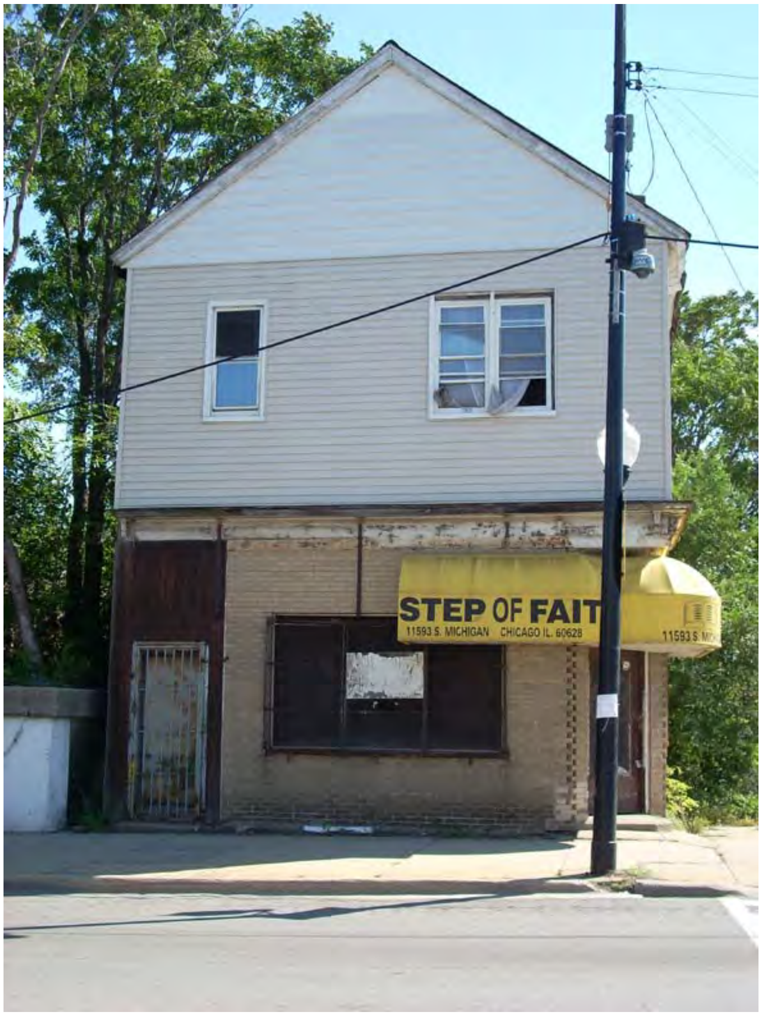
West façade of two-story, mixed-use building.



Property Description: **Stories:** 2

This two-story, frame, mixed-use building at the northeast corner of Michigan Ave. and 116th Street in the West Pullman community is clad with synthetic siding (upper) and brick (lower) and has a front gable roof with asphalt shingles. The front elevation has a recessed brick storefront with an entrance at corner and one at the opposite end, which is covered with plywood. Neither the doors nor the windows appear to be original. The cornice above the first floor includes wood brackets. The second floor on both street elevations features non-original one-over-one aluminum-sash windows. This building lacks integrity, does not have distinguishing architectural features, and is not individually eligible for listing on the National Register.

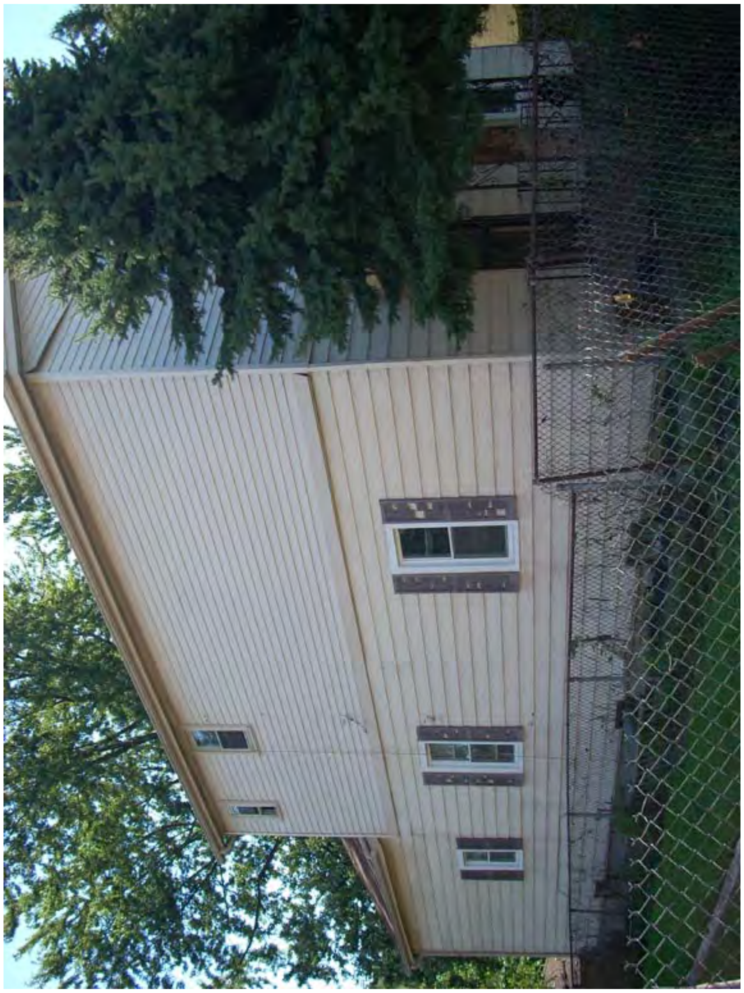
West and north façades of two-story, multi-family, frame building.



Property Description: **Stories:** 2

This two-story frame house in the West Pullman community is clad with synthetic siding and has a front gable roof with asphalt shingles. Its front elevation features an off-center non-original hollow core metal door fronted by a concrete stoop with metal railings and open metal posts supporting a metal canopy. There are two windows on the first floor and two on the second, all of which are non-original one-over-one aluminum sash.

The 1938 Sanborn shows this residence as a 1.5-story building with a round bay pavilion. Subsequent alterations, including the addition of a full second floor have heavily altered this building. This house lacks integrity, does not have distinguishing architectural features, and is not individually eligible for listing on the National Register.

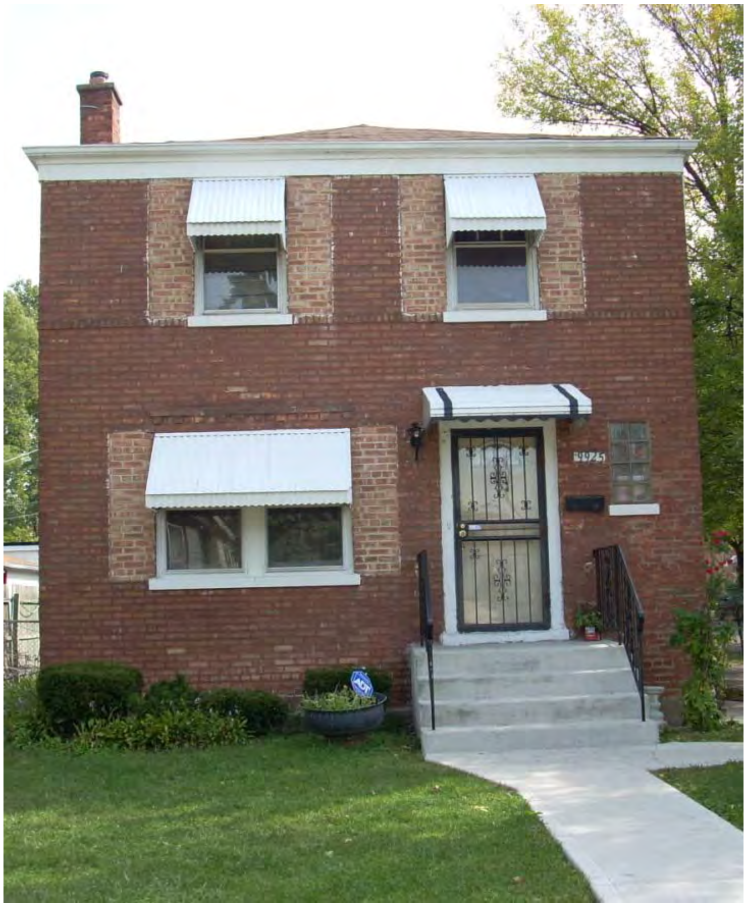
West façade of two-story, brick, single-family residence.



Property Description: **Stories:** 2

This two-story brick-clad house at the southeast corner of Normal Avenue and 99th Place in the Washington Heights community is situated on a raised basement with glass block windows. The building has a hip roof covered with asphalt shingles. Its front elevation has an off-center non-original hollow core metal door, a small adjacent glass block window, concrete steps with metal railings, a pair of non-original double-hung windows on the first floor, and two non-original double-hung windows on the second floor. The door and all front elevation windows have metal awnings. Details include a brick stringcourse and corbelling above first floor window. The difference in the brick colors relates to the removal of shutters. It does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

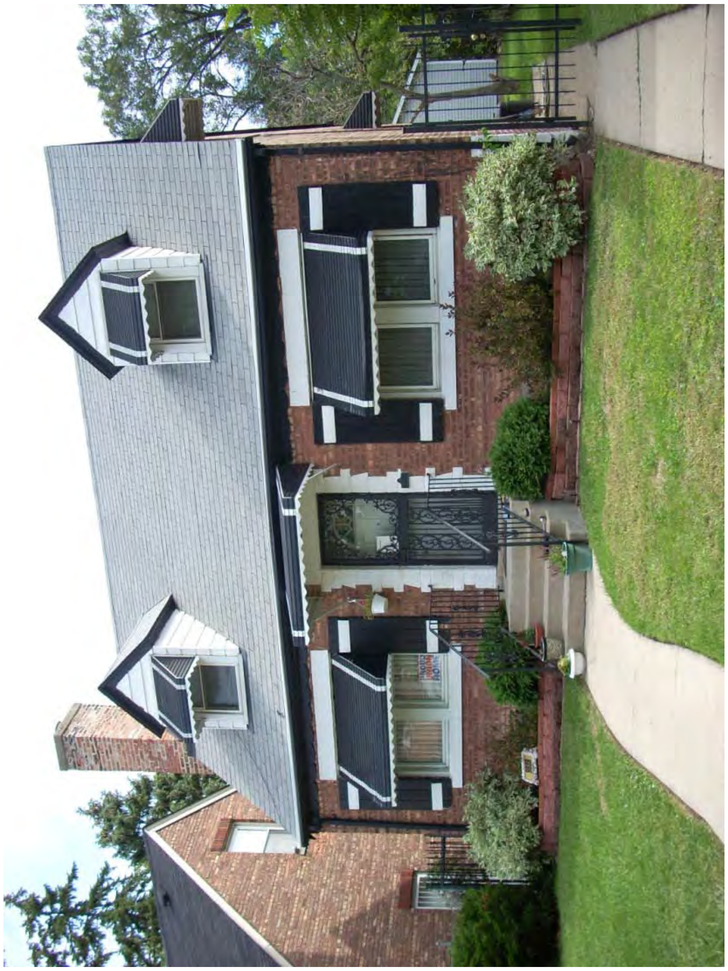
West façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story brick-clad house in the Washington Heights community is situated on a raised brick basement with glass block windows. It has a side-gabled roof covered with asphalt shingles. Its front elevation has a centrally located hollow metal paneled door with fanlight, concrete steps with metal railings, two sets of paired windows, and two aluminum-clad gabled dormers, each of which has one window. Windows are non-original one-over-one aluminum-sash. All front elevation windows and the front door feature metal awnings. Detailing includes concrete sills, lintels, and quoins surrounding the door. This house does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

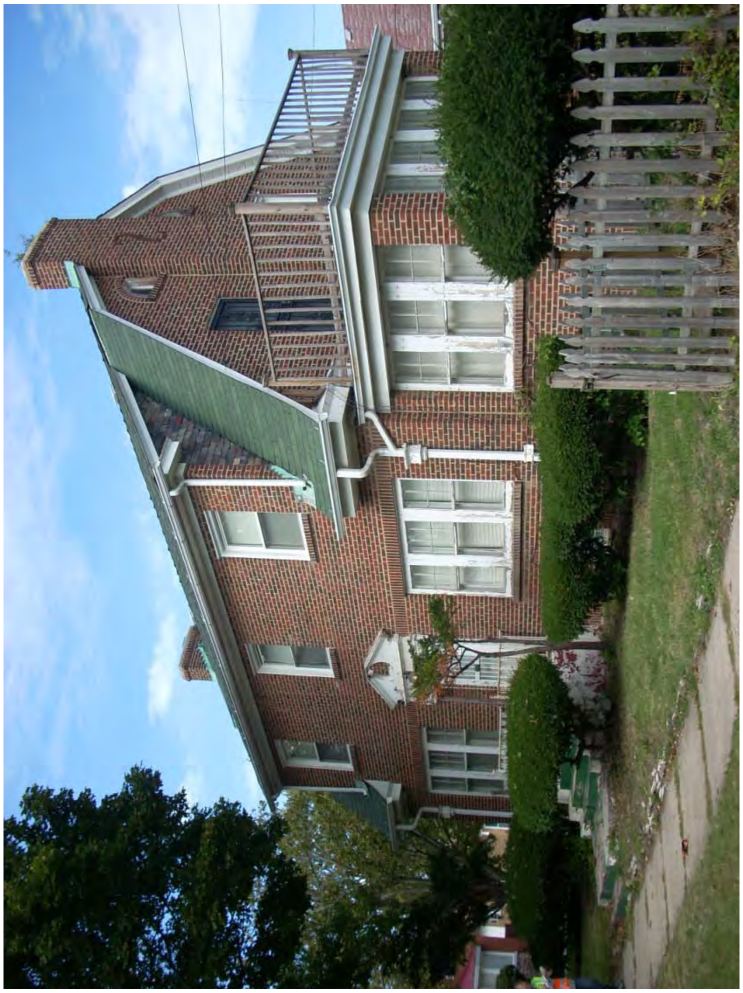
South and west façades of a brick, two-story, single family residence.



Property Description: **Stories:** 2

This two-story Dutch Colonial style house at the northeast corner of Normal Avenue and 105th Street in the Roseland community is situated on a raised basement and is clad with red face brick. The building has a side-gambrel roof covered with asphalt shingles, a one-story flat-roofed enclosed sun porch surrounded by four-over-one wood-sash windows along its east elevation, and exterior chimneys on both side elevations. The front (105th Street) elevation has a centrally located non-original hollow core metal paneled door, concrete steps, and metal railings. The door was once flanked by fluted pilasters with geometric capitals. The shaft of one of these pilasters has been removed as has the base of the extant pilaster. The door is topped by an unadorned frieze band and a broken pediment and is flanked by strips of three six-over-one and four-over-one wood-sash windows on either side. The shed-roofed second floor of the front elevation has three non-original one-over-one aluminum-sash windows. This house does not have sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This two-story brick-clad house in the Roseland community is situated on a raised basement with glass block windows and has a hip roof covered with asphalt shingles. Its front elevation features a pent roof that spans the three-sided living room bay and an off-center hollow core metal door that is accessed by concrete steps with metal railings. The living room bay features a picture window flanked by non-original one-over-one aluminum-sash windows that are sheltered by a metal awning. The second floor of the front elevation has two non-original one-over-one aluminum-sash windows. Detailing includes concrete sills and decorative stones at the basement level. It does not feature distinguishing architectural features nor does it retain sufficient integrity, therefore, is not individually eligible for listing on the National Register.

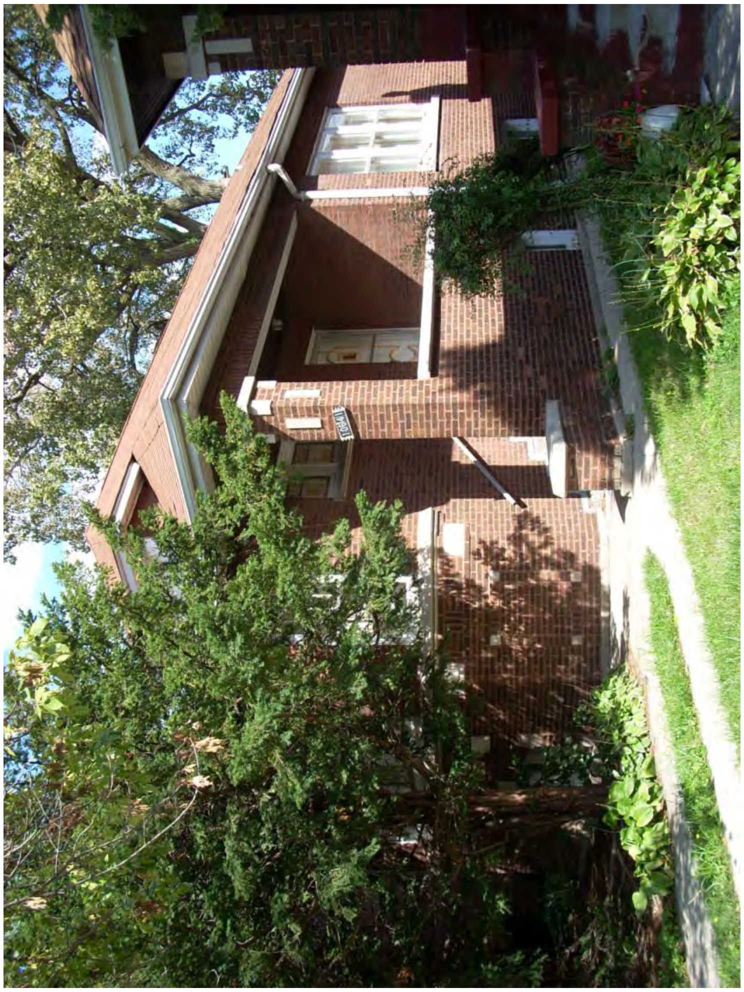
West façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story bungalow in the Roseland community is situated on a raised basement with glass block windows and clad with brown brick. The building has a hip roof covered with asphalt shingles, overhanging eaves, and a hip dormer, the windows of which were obscured by foliage. The house features a recessed corner porch with a hollow core metal door, concrete steps, low brick sidewalls, and a brick corner pier. The front elevation's projecting living room bay has a series of double-hung windows, a decorative brick soldier course, stone insert blocks, and concrete sills. This house does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

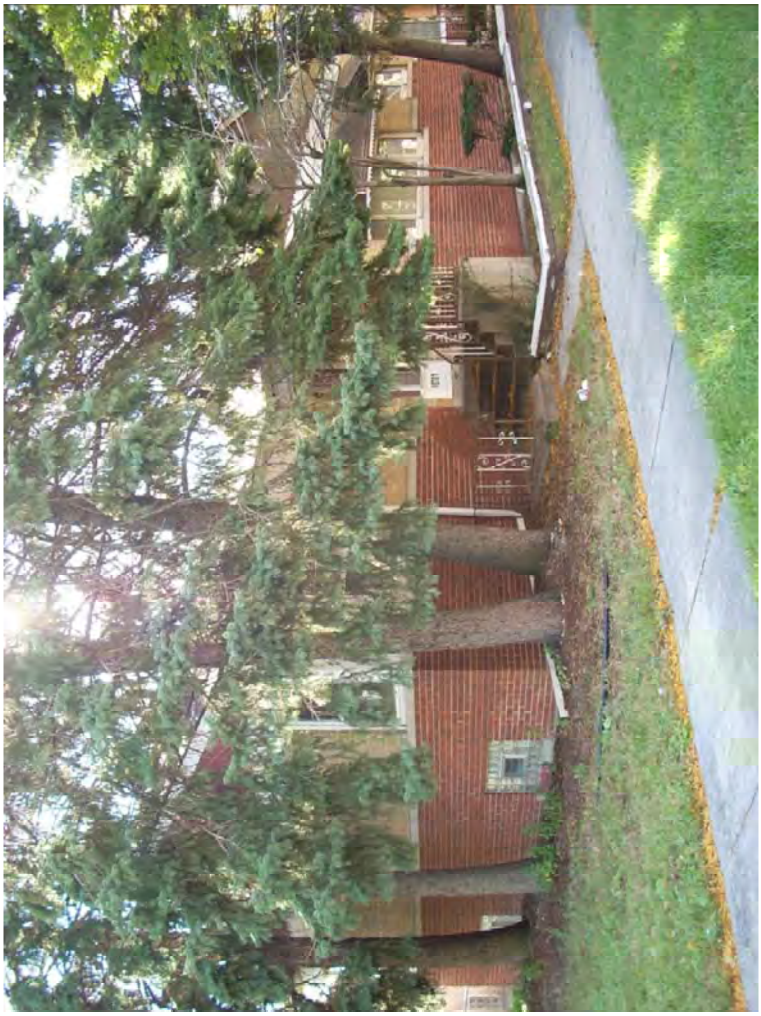
West façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story Ranch house at the corner of Normal Avenue and 107th Street in the Roseland community is situated on a raised basement and is clad with orange face brick below the sill line and buff brick above. The building has a cross-gable roof covered with asphalt shingles; gable ends are clad in synthetic siding. A gabled rear wing contains an attached two-car garage. The front (Normal Ave.) elevation has an off-center metal storm door sheltered by a roof overhang supported by a corner open metal post, concrete steps with metal railings, two pairs of non-original one-over-one aluminum-sash windows, and a non-original picture window flanked by one-over-one aluminum-sash windows on the main block. The front elevation of the rear wing has an off-center metal storm door, a roof overhang supported by two open metal posts, and a large glass block window. The side (107th Street) elevation has corner windows that are obscured by foliage but appear to be casements. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

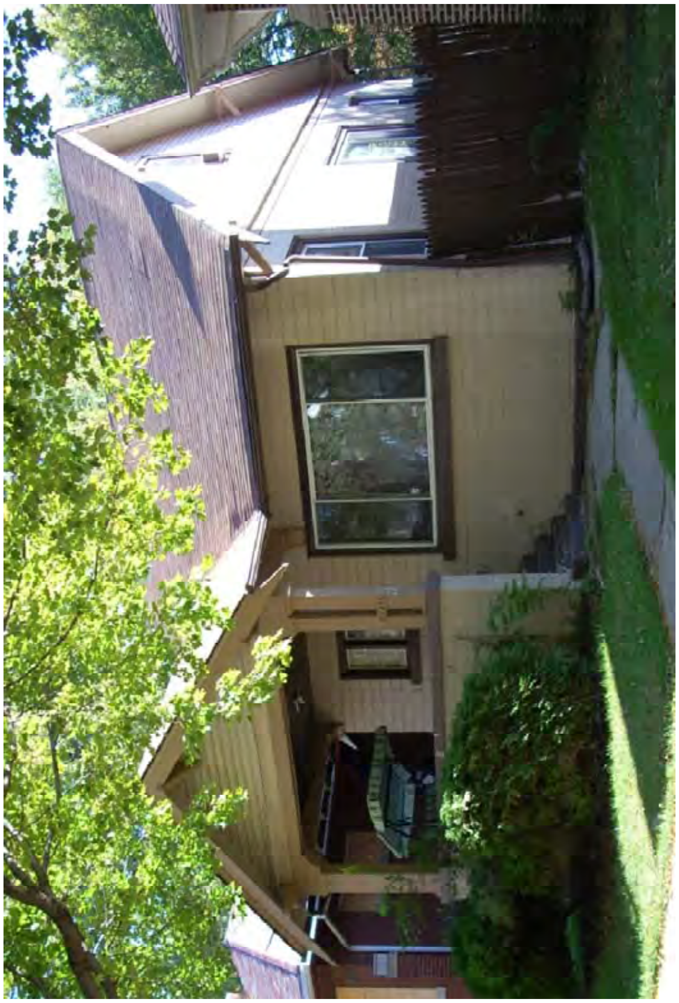
South and east façades of a one-story, single family residence.



Property Description: **Stories:** 1

This one-story Craftsman cottage in the Roseland community has a side-gable roof with overhanging eaves and decorative knee braces. The building is made of masonry units with aluminum siding in its gabled ends. Its front elevation has a recessed corner porch with overhanging gable roof with rafter tails, low walls, and squat, squared wood column supports. The building features a front door tucked into the side of the living room bay, a strip of three casements, and a picture window flanked by what appear to be casements. All windows on the front elevation feature concrete sills. Side elevation windows appear to be non-original one-over-one aluminum-sash. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

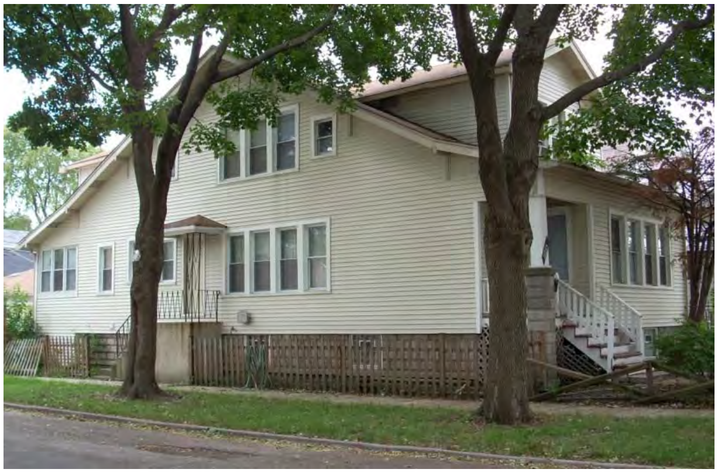
West and north façades of residence.



Property Description: **Stories:** 1

This single story frame house at the southeast corner of Normal Avenue and 110th Place in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a side gable roof covered with asphalt shingles and flared, bracketed, overhanging eaves. It features both front and rear gable dormers. It has a recessed corner porch with non-original hollow core metal door, a faux stone corner pier topped by a squat squared wood column, and wood steps and railings. The front elevation has a strip of four windows on the first floor and three in the gable. Above the basement, windows are non-original one-over-one aluminum-sash. A small hip-roofed porch is situated along the 110th Place elevation with hollow core metal door (non-original), concrete steps with metal railings, and open metal supports. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

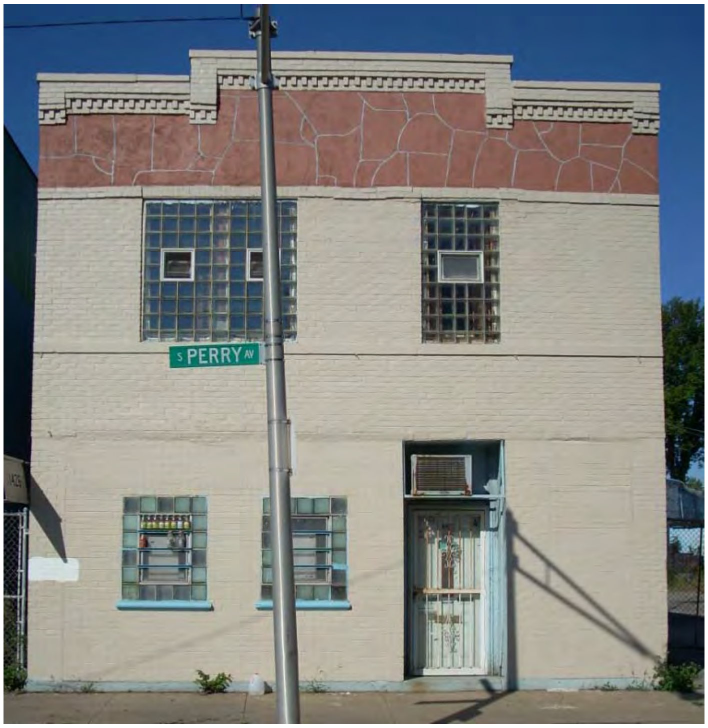
East façades of brick building in industrial complex.



Property Description: **Stories:** 2

This two-story industrial building in the Roseland community has a flat roof and parapet. It sits within an industrial complex bounded by South Perry Avenue, an alley, and the Union Pacific Railroad line. Its front elevation is clad in painted brick. It has a hollow core metal door with in-filled transom and window openings on the first and second floors that are in-filled with glass block with louvered or casement insets. Most of the face brick at the parapet level has been replaced by a stucco-like material. The uppermost portion of the stepped parapet has bricks arranged as decorative dentils. Other buildings within the paint company complex include one-story sheet metal and brick buildings. These buildings lack integrity, do not have distinguishing architectural features, and are not individually eligible for listing on the National Register.

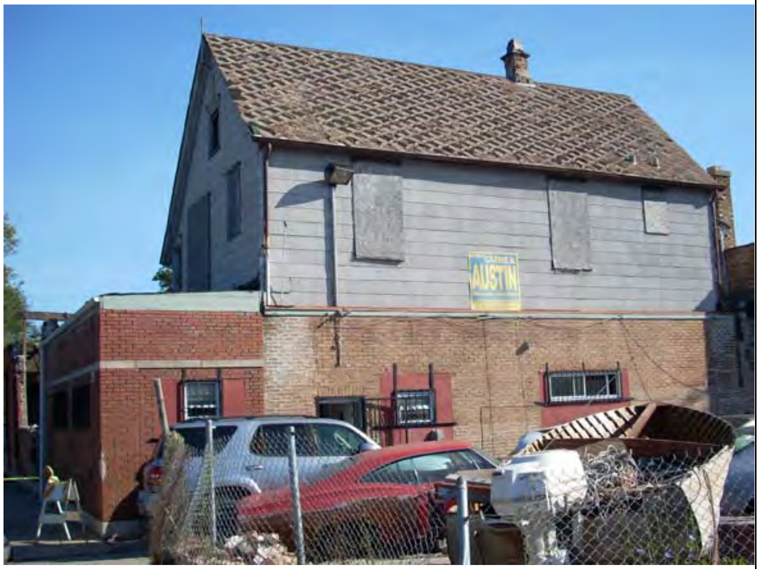
South façade of “building A” in a set of three joined industrial buildings. (Additional photographs appended).



Property Description: **Stories:** various

This industrial complex of buildings in the Roseland community includes three conjoined brick buildings: a two-story gable-roofed building (A, photo above), a collapsed brick building (B, photos on page 3), and a two-story flat-roofed brick building (C, photos on page 3). Building A has first floor clad in brick with a one-story, flat-roofed, brick commercial wing in front. The upper half of this building is clad in synthetic siding covering clapboards. It is vacant, deteriorated, and many of its window openings have been covered with particle board. Windows along the south side on the first floor are sliding or double-hung. Building B has collapsed. Building C at the far north has a parapet and is clad with red face brick and common brick. The windows with arched lintels have been in-filled with wood and brick. A new door pierces the façade. This complex of building lacks integrity, does not have any distinguishing architectural features, and is not individually eligible for listing on the National Register.

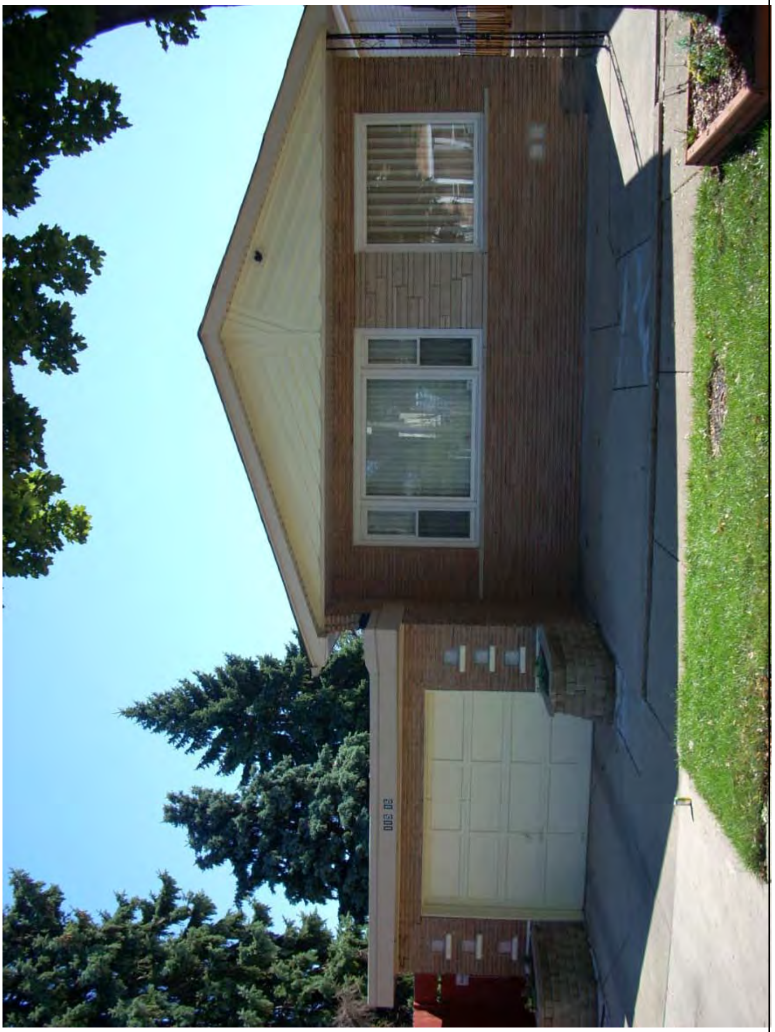
West façade of one-story, brick, single family residence.



Property Description: **Stories:** 1

This one-story house in the West Pullman community has a gable roof covered with asphalt shingles, overhanging eaves, and a flat-roofed attached one-car garage. Glass blocks with stone sills and brick planter boxes decorate the front of the garage. The front elevation of the house is clad with light orange face brick and features two picture windows, one of which is flanked by narrow one-over-one windows. A stone panel separates the two picture windows. The front gable is clad with synthetic siding in a decorative pattern. The entrance is located along the side elevation and accessed via a flight of concrete steps with metal railings. This house does not feature distinguishing architectural features and is not individually eligible for listing on the National Register.

Photos with Captions:
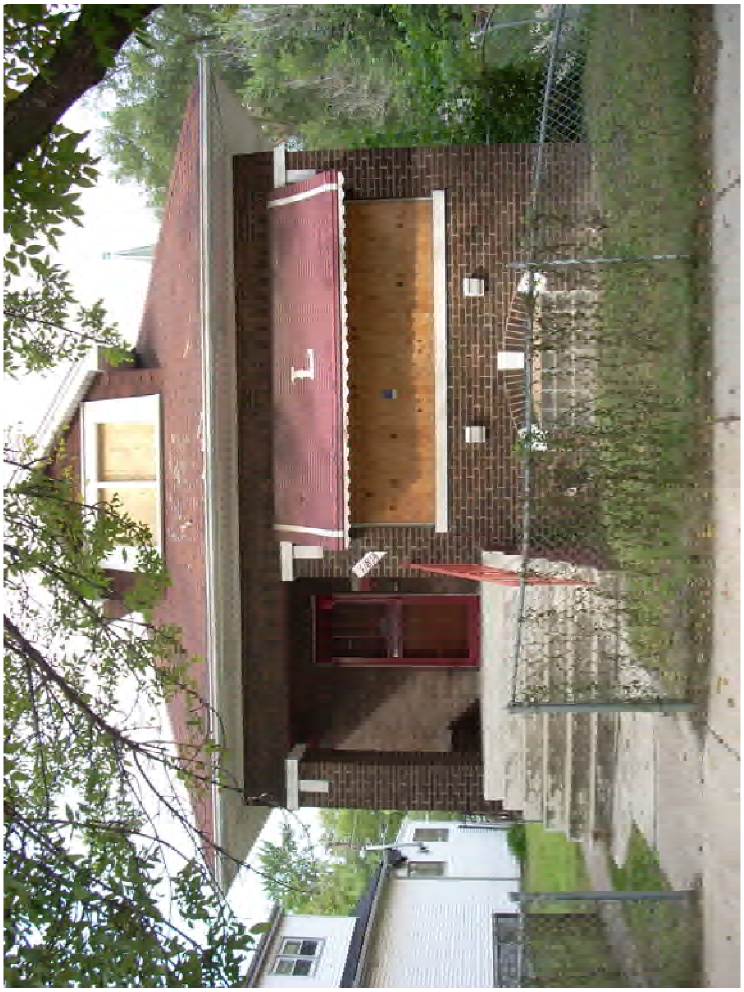
East façade of a one-story, single family, brick residence.



Property Description: **Stories:** 1

This one-story brick-clad bungalow in the West Pullman community is situated on a raised basement with glass block windows. The building has a hip roof covered with asphalt shingles, overhanging eaves, and gable dormers along its front and rear elevations. The front elevation has a recessed corner porch with a brick pier support at the corner, concrete steps, and a metal railing. Above the basement, windows have been covered with plywood. Detailing includes soldier brick lintels, concrete sills, and concrete insert blocks used as decorative accents. This is an example of a Chicago bungalow, a building type that the City of Chicago has recognized through its Historic Chicago Bungalow Initiative. However, this house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

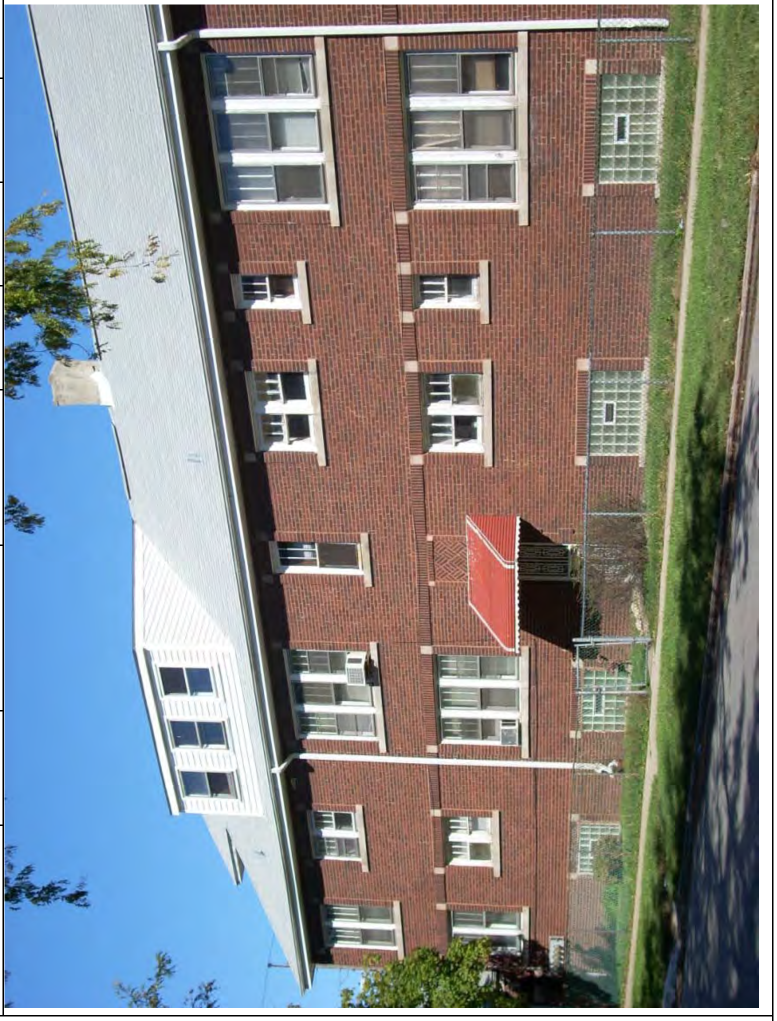
South façade of two-story, multi-family residence.



Property Description: **Stories:** 2

This two-story multi-family building at the northwest corner of 100th Street and Princeton Avenue in the Roseland community is clad with brown face brick along its two street elevations. It has a raised brick basement with glass block windows, a hip roof covered with asphalt shingles with overhanging eaves, a shed dormer along its 100th Street elevation, and a hip dormer along its rear elevation. The front elevation has an off-center hollow core metal door with two strips of three windows—one on the first floor and one on the second—along with an additional window on the second floor. Fenestration along both street elevations is comprised of three-over-one wood-sash windows. Detailing includes concrete sills, window surrounds with soldier bricks and square concrete insert blocks, and a course of soldier bricks above the first floor windows that spans both street elevations. The brick panels above both the front and side doors feature the same decorative basketweave pattern. This building does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This split-level home in the Roseland community has a cross-gabled roof covered with asphalt shingles and is clad with buff and orange face brick. The front elevation's gable is clad with aluminum and has a deep overhang that is supported by two open metal posts. The roofline exhibits an overhanging shed roof along the ridgeline, running the width of the house. The eave of this overhang is clad in vinyl siding. The front elevation's windows and door are obscured by high foliage. Three of the four side elevation windows are covered with plywood. This house does not feature distinguishing architectural features and is not individually eligible for listing on the National Register.

Prepared By: J. Martinez, M. C. Bird, J. Guarino **Photo By:** Steve Katz **Date:** 9 October 2012	

Property Description: **Stories:** 2

This two-story house in the Roseland community is situated on a raised brick basement. It is clad with brown face brick and has a cross-gable roof covered with asphalt shingles. Its front elevation has an arched basement window group, an off-center door with a metal storm, a corner recessed porch with concrete steps and metal railings, a projecting three-sided hip-roofed living room bay with five double hung sash windows, and a strip of three one-over-one windows on the second floor. Detailing includes a stone sill course and a decorative soldier course with stone insert blocks above the living room bay windows, decorative scrolled stone brackets below the living room bay windows, and a porch archway with stone keystone. The side elevation has a shed-roofed window bay with large glass block window opening. The rear elevation's original roofline has been raised with a shed-roofed addition. This house does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

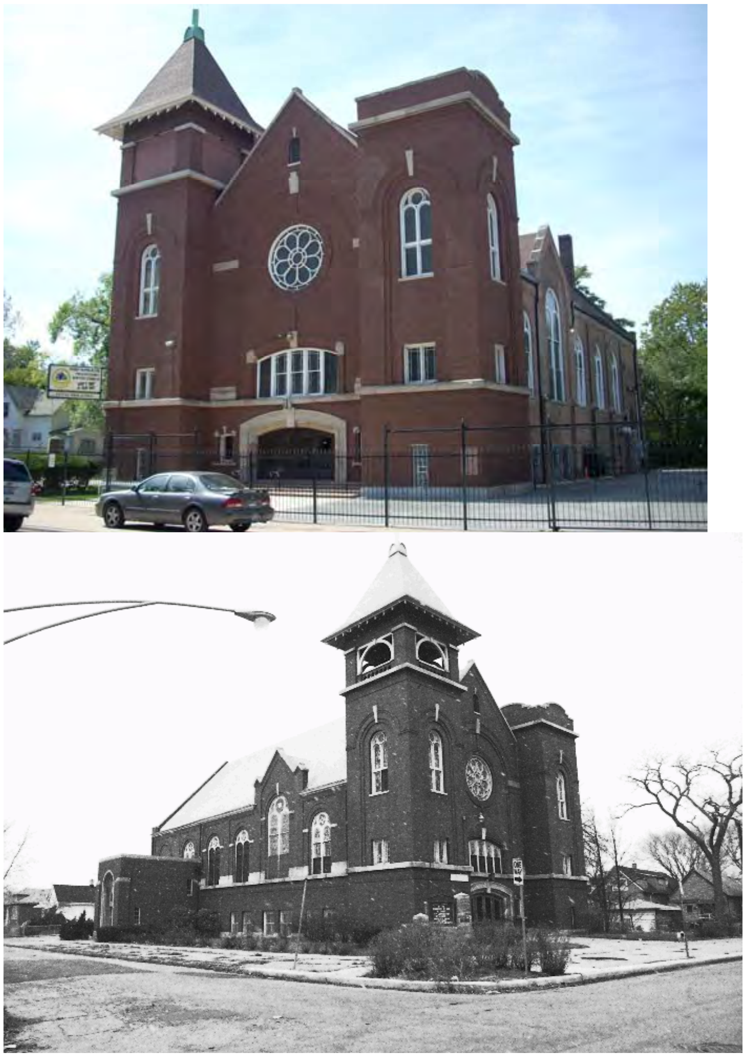
Photos with Captions:
East façade of two-story religious building (above), south and east facades from HAARGIS (below).



Property Description: **Stories:** 2

This Romanesque Revival style church in the Roseland community has a front elevation and two flanking towers clad with brown face brick, while the remainder of the side elevation and the rear elevation are clad with common brick. It has a gable roof covered with asphalt shingles and gable wall dormers with shaped parapets on both side elevations. The east tower has a flat roof and a shaped parapet while the west tower has a peaked roof with overhanging eaves and exposed rafters and is topped by a finial. The central bay of the front elevation has a broad, round-arched entrance with stone surround and two sets of single-light oak double-doors. The central bay also contains a strip of double-hung windows situated within a broad arch and a rose window with tracery. Fenestration on the both towers and along the side elevations comprises round-arch windows with tracery. It is unknown whether the original stained glass for all of these windows is extant inside the church. Both towers also feature paired casement windows. Window openings at the top of the west tower have been boarded-over. Detailing includes stone sills, belt courses, brick pilasters and keystones. A one-story brick-clad entrance vestibule is situated along the rear of the west elevation. Built as the First Reformed Church of Roseland, this church is recommended as individually eligible for National Register listing under Criterion A for its association with the community's once-dominant Dutch population and under Criterion C as fine example of a Romanesque Revival style church in Roseland.

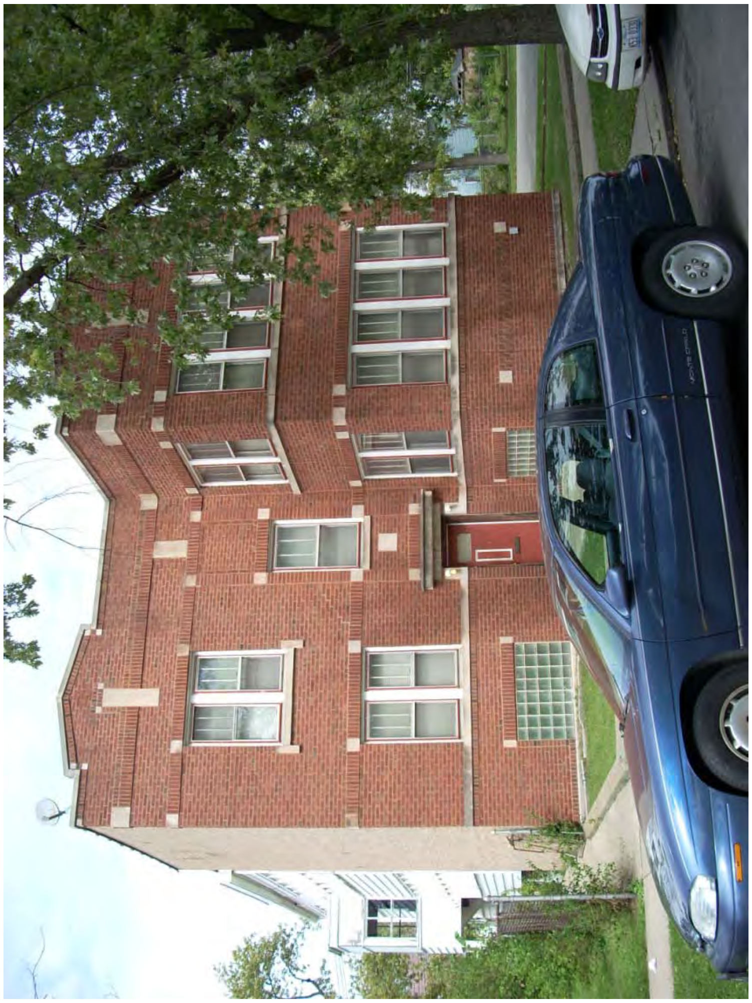
South façade of a brick, two-story, apartment building.



Property Description: **Stories:** 2

This two-story apartment building at the northwest corner of Princeton Avenue and 111th Place in the Roseland community is situated on a raised basement with glass block windows and is clad with brown face brick on its two street elevations. The building has a flat roof and shaped parapet with concrete coping. Windows are original three-over-one wood-sash windows arranged singly, in pairs, or in groups of four. The Princeton Avenue elevation also features four leaded glass casement windows. Each street elevation has an entrance with a non-original hollow core metal door. Detailing includes concrete sills and brick soldier courses with square stone inserts blocks. This building lacks sufficient distinguishing architectural features and is not individually eligible for listing on the National Register.

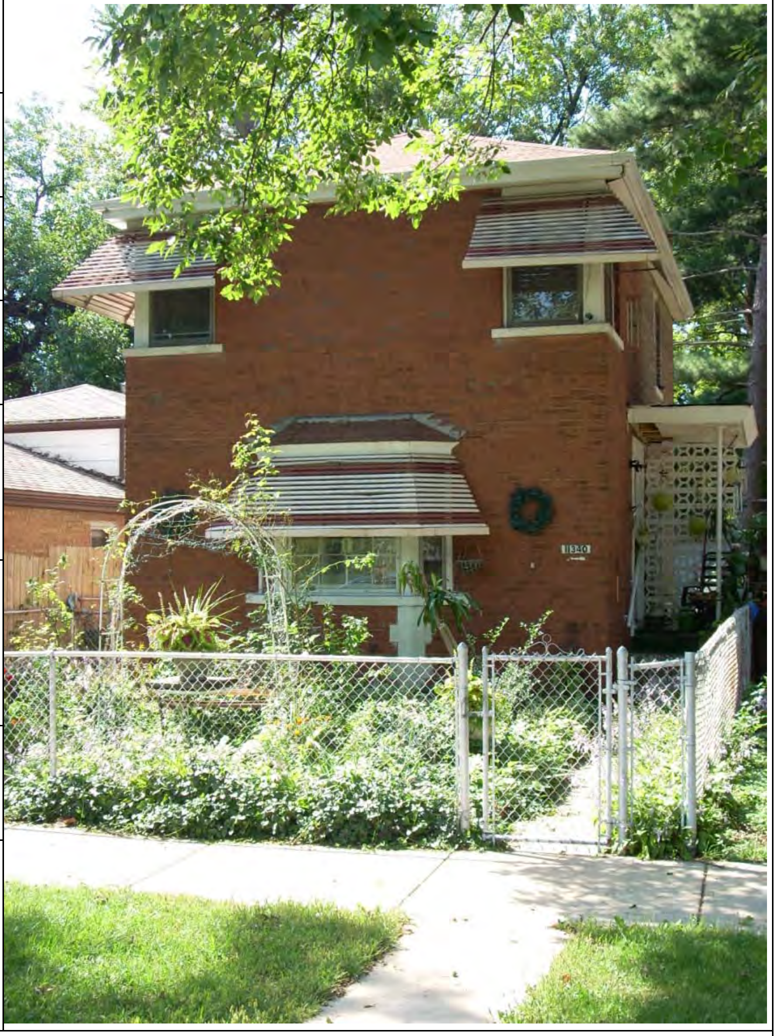
East façade of two-story, brick, single family residence.



Property Description: **Stories:** 2

This two-story home in the Roseland community is clad with face brick and common brick on the front and side elevations, respectively, and has a hip roof covered with asphalt shingles. The front façade has a three-sided bay window on the first floor and casement windows at each corner of the second floor, each topped by an awning. Details include concrete quoins on the bay and concrete sills. The main entrance is located along the side elevation, which contains an entryway porch topped by a flat roof supported by metal pole. Decorative lattice is present at the entrance. This building lacks sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Prepared By: C. Tolmie, M. C. Bird, J. Guarino **Photo By:** S. Katz **Date:** 10 September 2012	

Property Description: **Stories:** 1

This one-story house in the West Pullman community is situated on a raised concrete block basement with a stone veneer. Above, it is clad with aluminum siding and has a gable roof covered with asphalt shingles. Its front elevation features a pent roof with decorative knee braces, an off-center door, concrete steps with metal railings and a strip of three non-original one-over-one windows. The window opening in the gable contains a pair of narrow casements. This house lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story house in the West Pullman community is situated on a raised basement with glass block windows and is clad with common brick. It has a steeply pitched hip roof covered with asphalt shingles and a shed dormer with sliding glass windows. Its front elevation features a centrally located hollow metal paneled door (non-original) flanked by paired, double-hung windows. The porch has concrete steps, metal railings and supports, and a metal canopy roof. Detailing includes rusticated stonework at the basement corners and around the door. This house does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

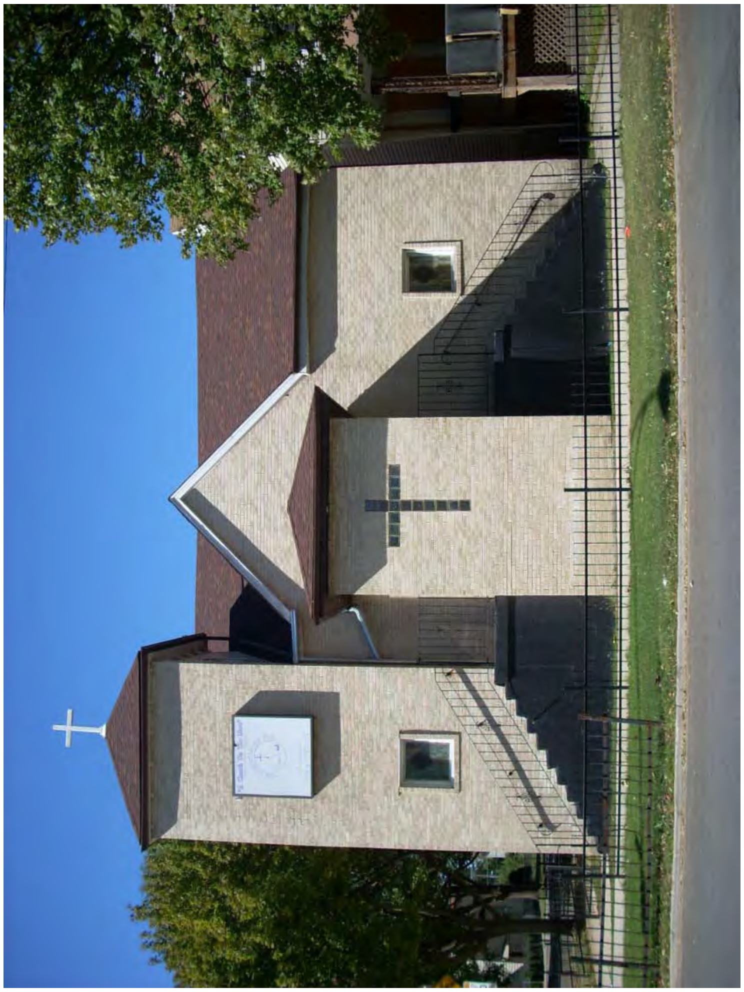
East façade of a brick, 1.5-story religious building.



Property Description: **Stories:** 1.5

This church at the corner of State and 116th streets is clad in buff face brick on a concrete block foundation. The building has a raised basement, gable roof covered with asphalt shingles, and a square corner tower with a hip roof. Its front (State Street) elevation has a centrally located hip-roof entrance pavilion with metal stairs on both sides and a gable wall dormer above. The pavilion features a cross of glass blocks and the flanking walls each have a single square leaded glass window. The side (116th Street) elevation features one large and two small pointed arch windows. This church lacks sufficient distinctive architectural features to qualify as individually eligible for listing on the National Register.

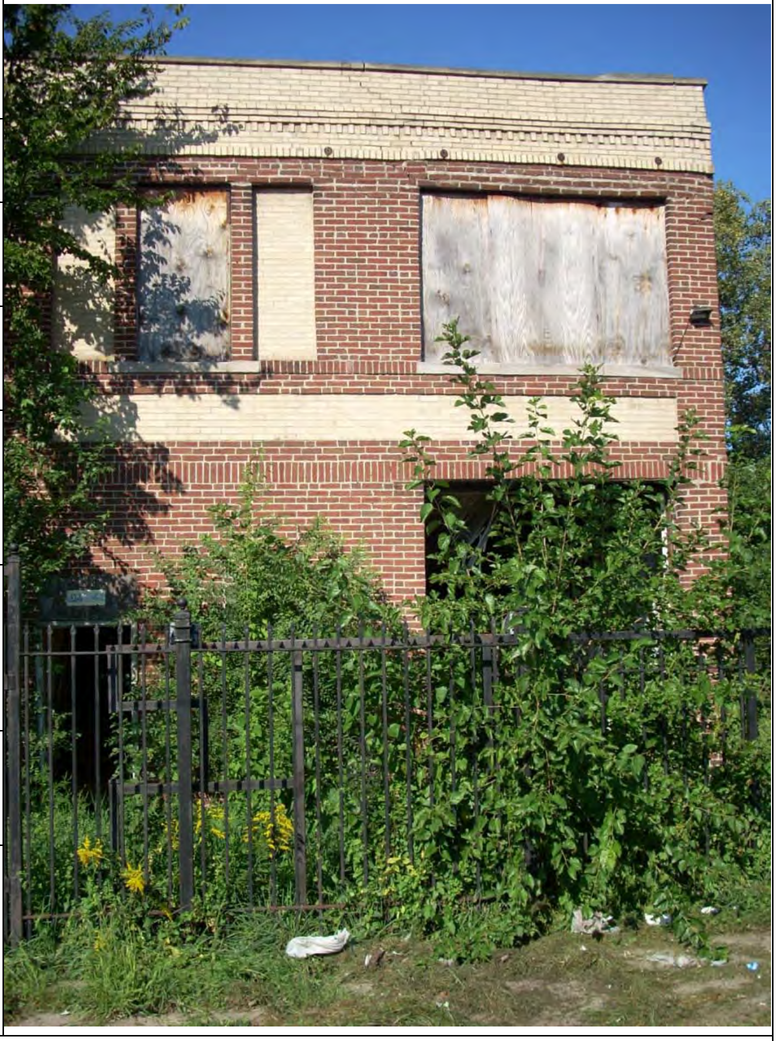
East façade two-story, brick light industrial building.



Property Description: **Stories:** 2

This two-story light industrial building is clad with face brick and common brick along its front and side elevations, respectively, and has a flat roof and parapet. The front elevation has an off-center entrance with no door, a large window opening on the first floor that is obscured by foliage, and window openings on the second floor that have been in-filled with both wood and brick. The buff brick between the first and second floors and at the parapet level contrasts with the red brick cladding of the front elevation and may be non-original. Detailing includes dentil molding on the parapet, banding in brick, and stone sills. Side elevation windows are in-filled with glass block. This building lacks integrity and architectural distinction and is not individually eligible for listing on the National Register.

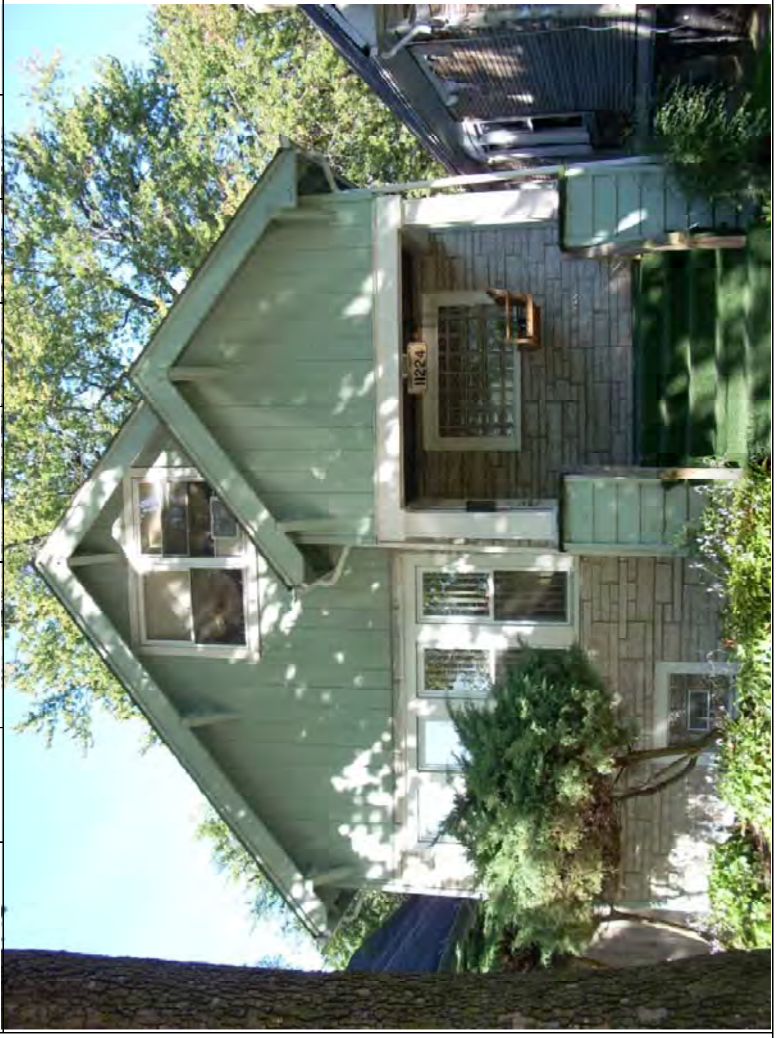
East façade of 1.5-story, frame, single family residence.



Property Description: **Stories:** 1.5

This 1.5-story house in the Roseland community is situated on a raised brick basement with glass block windows. The building has a front gable roof covered with asphalt shingles and overhanging eaves with decorative knee braces. The front elevation is covered with faux stone to the top of the first floor windows and in vertical synthetic siding above. It has a partially recessed gable-roofed corner porch with sidewalls covered with synthetic siding, two low squared wood column supports, and wood steps. A glass block window and hollow core metal door are tucked into one side of the porch. A strip of four windows on the first floor and a pair of windows in the gable are non-original one-over-one aluminum-sash. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

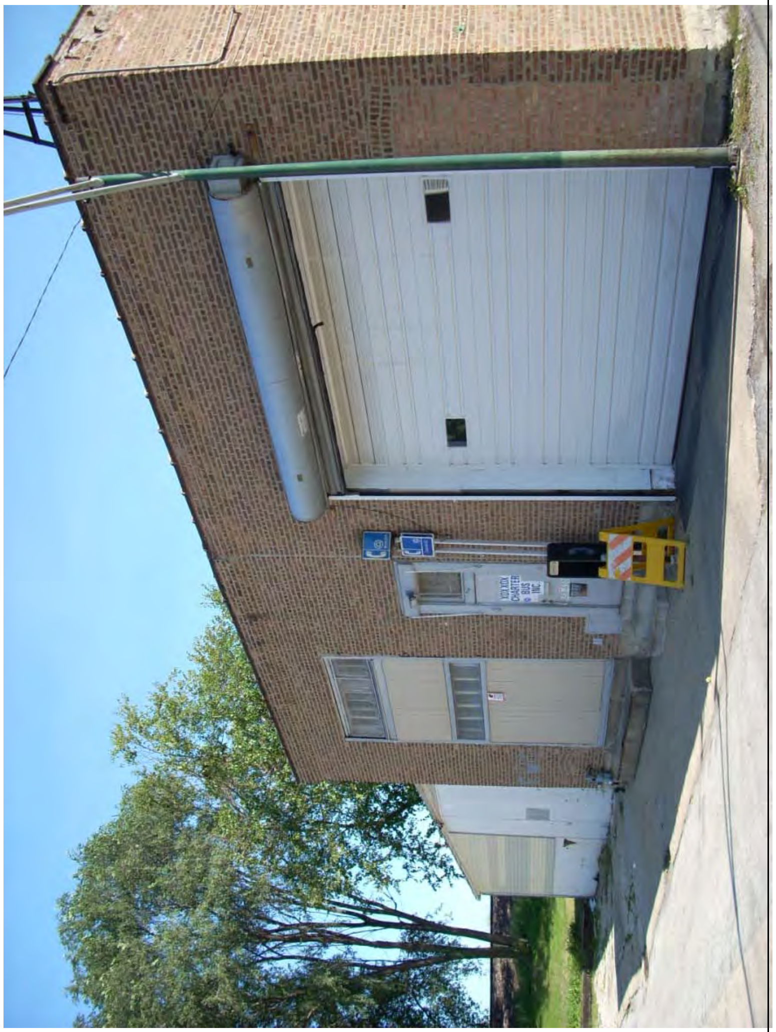
East façade of brick bus garage building.



Property Description: **Stories:** 1

This one-story former warehouse in the West Pullman community is clad with common brick and has a flat roof, parapet, and a shed-roofed frame wing. Its front façade features the outline of an original door opening that has been in-filled with brick, a non-original overhead metal door, a metal door with transom, and a former door opening that has been in-filled with wood panels and two horizontal strips of small fixed-pane windows. One of the side elevations displays the outlines of former window openings that have been in-filled with brick while the other features an overhead metal garage door. This building does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

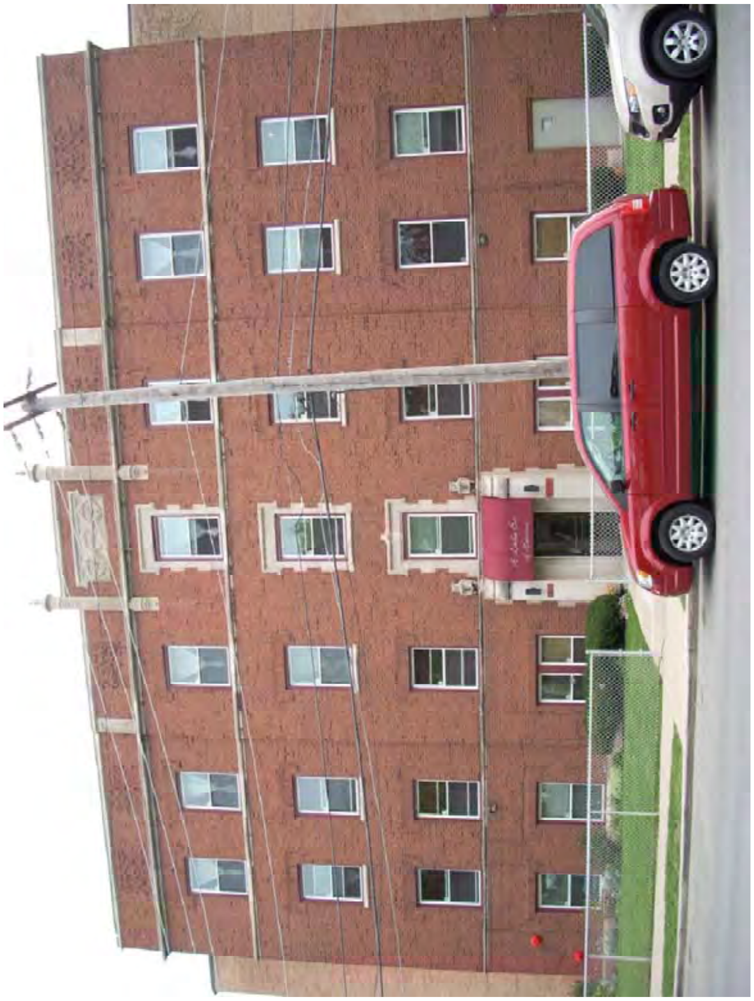
West façade of the four-story, brick building



Property Description: **Stories:** 4

This four-story building at the northeast corner of Wentworth Avenue and 113th Place in the Roseland community has a flat roof and parapet. Its symmetrical front (Wentworth Avenue) elevation is clad with brown face brick and has a centrally located entrance with a glass door and stone surround topped by two stone owls holding books. Windows are non-original one-over-one aluminum-sash; those directly above the entrance have stone casings. Detailing includes stone sills, coping, insert blocks, sill courses, cornice, panels, and pinnacles at the parapet level.

This building is recommended locally significant for National Register listing under Criterion A for Education. Formerly the Roseland Community Hospital Nurses Home, it was built by the hospital as a dormitory and educational facility for its nurses. Closely affiliated with Roseland Community Hospital, which has served as an important institution in the Roseland area since its establishment in 1924, the Nurses Home is an excellent example of this building type on Chicago's South Side. The exterior of the building has very good integrity and the interior—which now functions as a homeless shelter—appears to retain classrooms and other spaces associated with its original use.

Property Description: **Stories:** 1.5

This one-and-a-half-story frame cottage in the Roseland community is situated on a raised concrete block basement with casement windows and is covered with synthetic siding. The building has a gable roof with asphalt shingles. The front elevation has a hipped-roof wood porch with Doric columns, an off-center entrance with a hollow core metal panel door, a three-sided bay window on the first floor, and a strip of three windows in the gable. With the exception of the basement, windows are non-original one-over-one aluminum-sash. The north elevation has a hipped-roof wall dormer. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

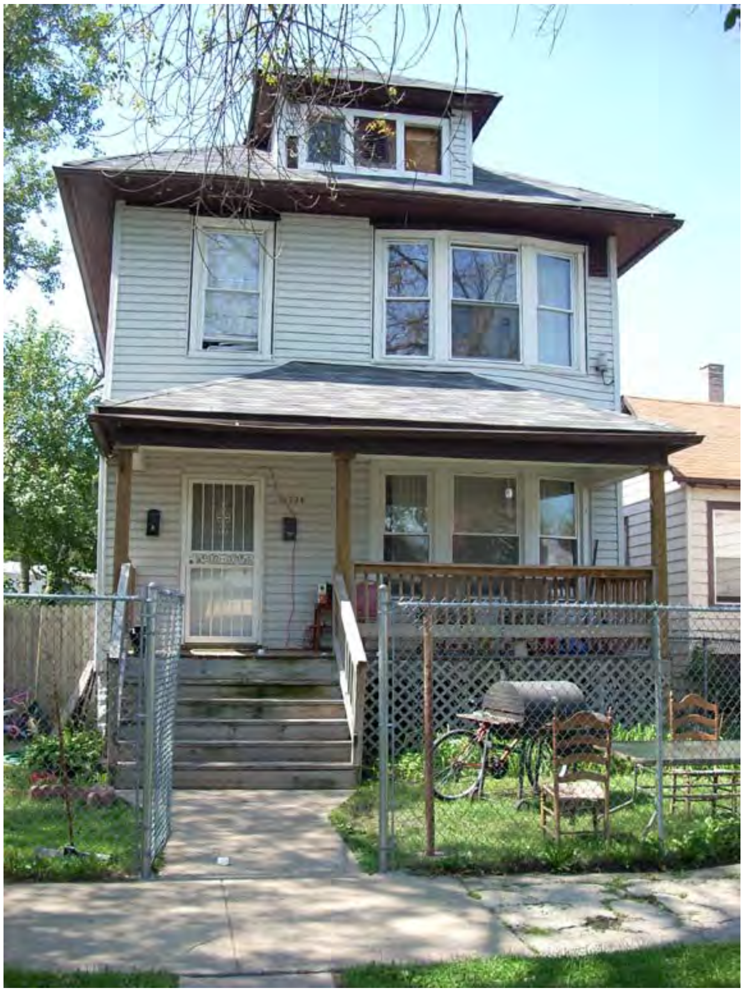
East façade of two-story, multi-family, frame residence.



Property Description: **Stories:** 2

This two-story home in the Roseland community is situated on a raised basement, clad in synthetic siding, has a hip roof covered with asphalt shingles and overhanging eaves. It features a full-width, hip-roof, wood porch. The front façade has an off-center door, three-sided window bays on the first and second floors comprised of non-original one-over-one windows, and a single one-over-one window on the second floor directly above the door. Its hip dormer has three window openings: two comprised of single-pane windows and a third that is covered with plywood. This building lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

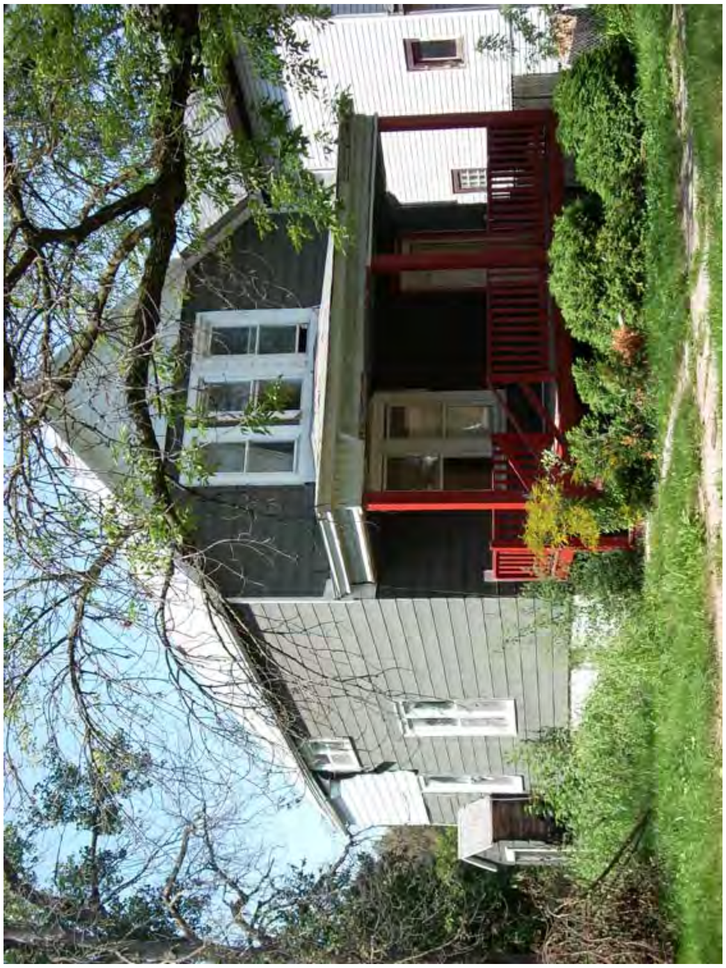
East façade of 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-one-half-story home in the Roseland community is situated on a raised basement and clad in two layers of synthetic siding. It has a gable roof covered with asphalt shingles and a full-width, hip-roof wood porch with non-original, wooden, square columns and rails. The front façade has an off-center, non-original, hollow metal core panel door with fanlight. It also has a three-sided window bay on the first floor comprised of non-original one-over-one windows and a strip of three, non-original one-over-one windows on the second floor. One of the side elevations has a three-sided bay window and gable wall dormer above. This building lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

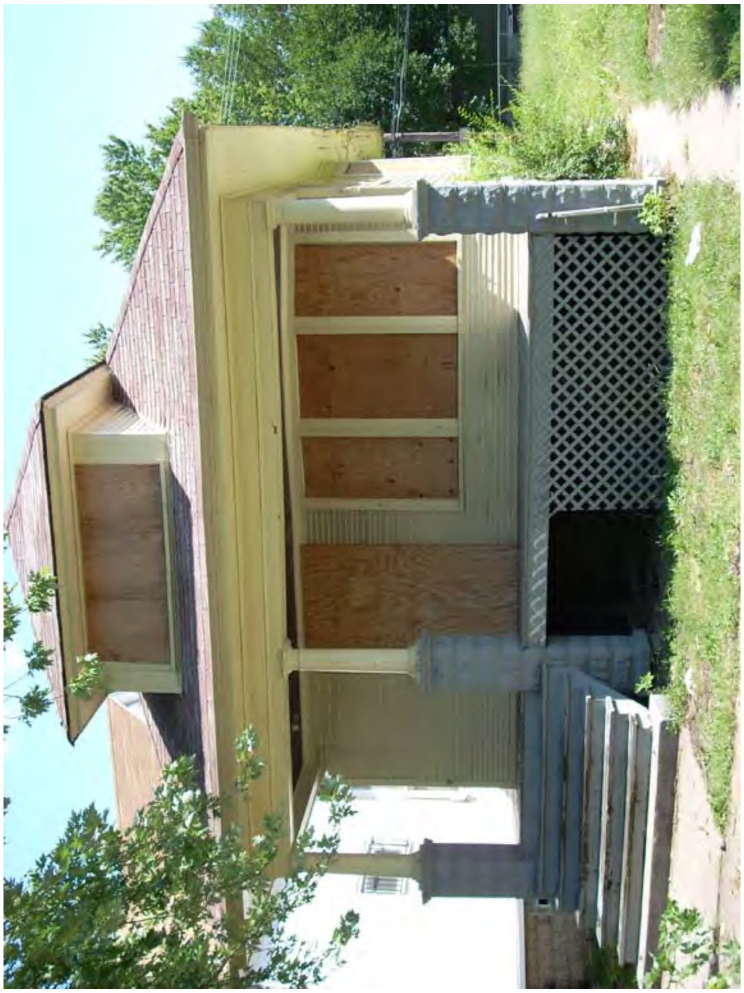
West façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman bungalow in the Roseland community is situated on a raised concrete block basement with glass block windows. Above, it is clad with synthetic siding on the sides and clapboards on the front. It has a hip roof covered with asphalt shingles, overhanging eaves, and a hip dormer. The roofline extends forward to shelter the full-width, hipped-roof, wood porch that is supported by low faux stone pedestals topped by squat wood Doric columns. The front elevation has an off-center door opening and a three-sided window bay. The door and all window openings have been covered with plywood. This building does not have sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

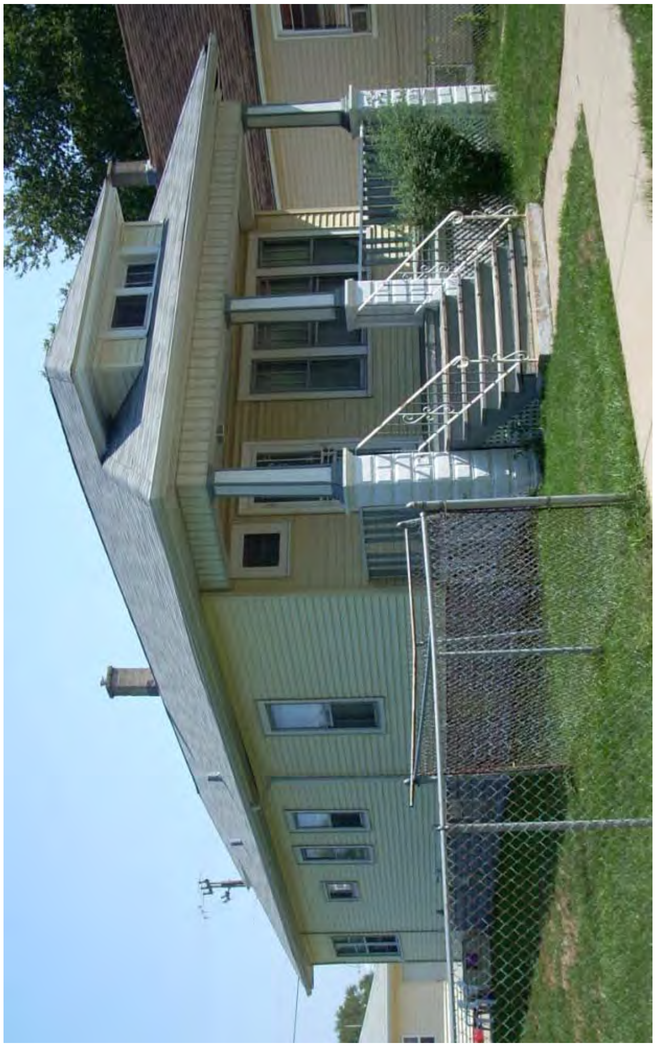
West and south façades of single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman style bungalow in the Roseland community is situated on a raised concrete block basement and is clad with synthetic siding. It has a hip roof covered with asphalt shingles and a hip dormer with a pair of single-pane or sliding windows. Its roof overhangs to shelter the full-width wood porch with supports consisting of faux stone pedestals topped by squared wood columns. The front façade has an off-center front door, an adjacent single-pane window, and a strip of four double-hung windows. Windows appear to be original wood-sash. This building lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

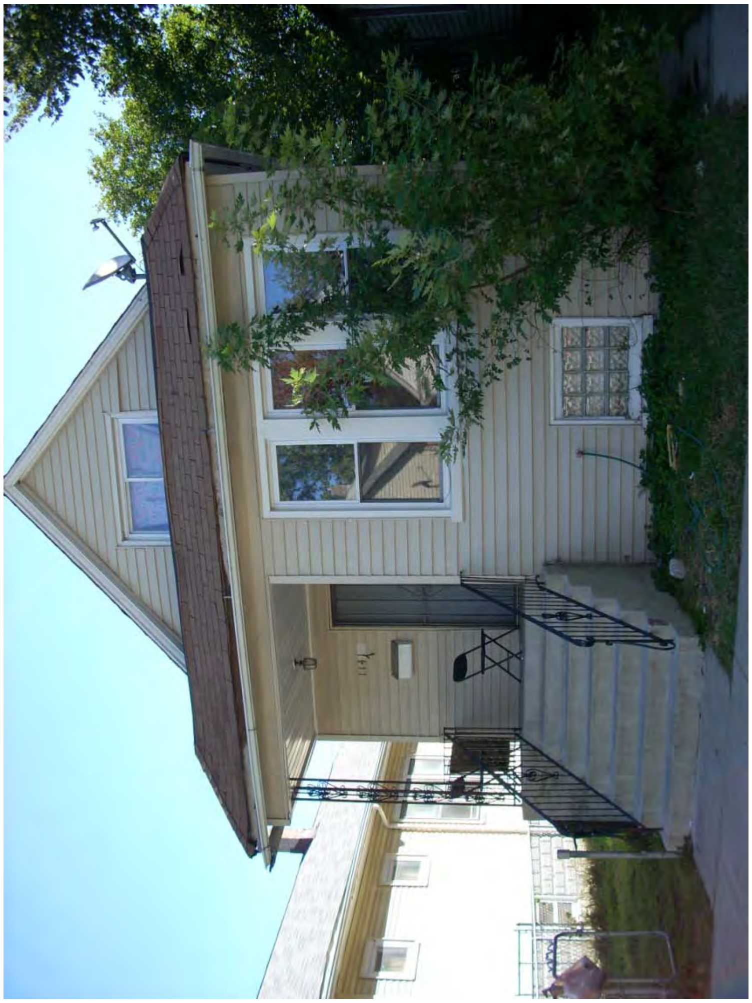
West façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story cottage in the Roseland community is situated on a raised brick basement with glass block windows and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. Its front elevation has a full-width porch with a mansard-like roof that is partially enclosed and covered with synthetic siding. This elevation of the porch also has a strip of three non-original one-over-one aluminum sash windows. The open portion of the porch has a metal storm door, concrete steps with metal railings, and an open metal corner post. A pair of non-original one-over-one aluminum-sash windows is situated in the gable. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

MEETING NOTES

RE: **Section 106 Kick-off Meeting**
Red Line Extension EIS

DATE: **October 24, 2012**

LOCATION: **Conference Call/Webinar**

TO: **Distribution and All Attendees**

ATTENDEES:

Name	Organization
Sonali Tandon	CTA
Reggie Arkell	FTA
Anne Haaker	IHPA (SHPO)
Jonathan Fine	Preservation Chicago
Terry Tatum	Chicago Historic Preservation Division
Lisa DiChiera	Landmarks Illinois
Erma Tranter	Friends of the Park
Helene Kornblatt	CWC Transit Group
John Mettille	CWC Transit Group
Rebecca Thompson	CWC Transit Group
Robert Ball	CWC Transit Group

PREPARED BY: Rebecca Thompson

ISSUE DATE: October 24, 2012

Meeting called to order at 1:00 pm CT

Objective: Red Link Extension Kickoff Meeting for Section 106 Consultation

Item No.	*Item Description*	*Responsibility*	*Due Date*
1	**Welcome/Intro** Sonali welcomed attendees and callers introduced themselves.		
2	**Overview of Section 106 Process** John Mettille provided an overview of the four-step Section 106 process. Reggie Arkell explained that FTA is overseeing the consultation process, working in conjunction with CTA. FTA will make determinations regarding eligibility and effects, referencing recommendations prepared by the consultant and considering input from consulting parties, including the SHPO. John discussed the roles of consulting parties and identified ground rules to ensure everyone has a fair chance to provide meaningful input.		

Item No.	*Item Description*	*Responsibility*	*Due Date*
3	**Project Info & Alternatives** Sonali provided a brief overview of the project area, the No Build alternative, and the three Build alternatives that are being considered: UPRR rail, Halsted rail, and Bus Rapid Transit. John presented the Area of Potential Effects (APE), which defines the geographic boundary where the analysis of historic resources will occur. A larger scale APE map is attached to the meeting summary.		
4	**Schedule/Next Steps** John explained the next steps in the process. Work is underway to identify potential historic properties. We are tentatively planning to hold a meeting to discuss the eligibility of resources in December. A meeting to discuss effects will occur in early 2013.		
5	**Question/Answer** - Jonathan: Is the purple segment on the alternatives map new or existing? It would be a new structure in the median of the expressway. - Reggie: What is the pier spacing for the Halsted Alternative? Spans between piers would typically be 60 to 100 feet, and as long as 140 feet. Span length would be based on site conditions, geometrics, and clearance requirements. - Jonathan: What advantages does the Halsted Alternative offer over the No Build Alternative? Halsted would extend the red line south to serve additional transit markets. The No Build Alternative includes improvements at the 95th Street station which are currently being planned but would not include an extension of the route or other improvements. - Jonathan: Which alternative has the least impacts on historic resources? That is part of what we will determine through this process. - Lisa: Is documentation of the previous study available online? Yes, the project website is http://www.transitchicago.com/redeis Please use following links to access specific materials: Locally Preferred Alternative Report and Scoping Report (http://www.transitchicago.com/Redeis/documents.aspx); Alternatives Analysis Materials (http://www.transitchicago.com/news_initiatives/planning/redextend.aspx) - Lisa: If we have additional information about resources, should we send it to the team? Yes, please direct it to Sonali at STandon@transitchicago.com. - Erma: Are parks covered in the 106 process too? Parks are protected under Section 4(f) regulation, which is a separate law; they will be addressed in the project EIS. The Section 106 process will deal with historic resources; if any parks in the area or park facilities are determined to be historic, they will be considered during the 106 process. If any historic resources are used by the project, they will be addressed under Section 4(f) as well. Parks that are not historic are subject to the 4(f).		

Please notify the author of the minutes of any corrections and/or clarifications within five (5) business days.

PREPARED BY: Rebecca Thompson

ISSUE DATE: January 31, 2013

Meeting called to order at 10:30 am CT

Objective: Red Link Extension Eligibility Meeting for Section 106 Consultation

Item No.	*Item Description*	*Responsibility*	*Due Date*
1	**Welcome/Intro** Sonali welcomed attendees. Reggie Arkell explained FTA's oversight role on the project. John Mettille reviewed the agenda.		
2	**Background & Regulations** John Mettille provided an overview of the four-step Section 106 process, which is intended to assess historic resources and their eligibility for listing on the National Register of Historic Places (NRHP). John identified ground rules to ensure everyone has a fair chance to provide meaningful input.		
3	**Review of Area of Potential Effects (APE)** John presented the APE, which defines the geographic boundary where the analysis of historic resources will occur. The area includes over 1,400 acres and 7,000 buildings.		
4	**Methodology for Identification of Historic Properties** The team developed historic contexts for each community in the APE to frame the evaluation of historic properties. The team also conducted field surveys and archival research for over 500 individual properties within the APE. The survey sample included all buildings that would be demolished by one or more alternatives and a sample of other properties; sample properties were concentrated in areas that are likely to experience greater effects. Based on this, eligibility recommendations were developed for individual properties. - Q: Did you look at properties less than 50 years in age that could be significant to the community? A: We primarily examined properties over 50, but we did look for overall significant properties as well as potential historic districts. - Q: Are Chicago Historic Resources Survey (CHRS) red/orange properties shown? A: They are noted in the summary table in section 3 of the handout packet. - Q: What research was done on the social history of the area? For example, what about identifying community meeting places or locations significant in the lives of civil rights leaders? Of the 7,000 buildings in the APE, it is concerning that only 10 are identified as eligible.		

Item No.	*Item Description*	*Responsibility*	*Due Date*
	A: The team developed historic contexts for each of the communities represented in the APE but these focused primarily on the built environment. Part of the intent of the consultation process is to gather your input about what additional resources are out there, particularly from organizations more familiar with the immediately vicinity and social history. If you have information about potentially significant resources, please let us know during the comment period.		
5	**Overview of Surveyed Properties** Nine properties were recommended eligible for NRHP listing. - Residence at 444 W 100th Place - Former substation at 10227 S Halsted Street (gas & electric for the city) - Fire Department at 324 W 104th Street - Roseland Pumping Station (still in use) - Residence at 11310 S Emerald Avenue - Church at 10920 S Princeton Avenue (currently Mary Magdalena Missionary Baptist Church) - Fire Department at 931 W 120th Street - Church at 12433-12439 S Halsted Street - Venetian Hall at 133-139 E Kensington Avenue (currently used as church and shelter) *Note: the address is correct but the property lies in the West Pullman community.* In addition, Altgeld Gardens was determined NRHP eligible in 1992 independent of the project. - Q: How do you account for the fact that the community is under surveyed and underserved? Underrepresentation undercuts the intention of the project. A: The team prepared historic contexts for each community, consistent with the state of the practice. Beyond that, we rely on your input. Once you provide your comments, the team will establish a strategy to move forward. We will respond to comments received and keep you informed. - Q: Does the list of surveyed properties fully cover the area to be considered in the historic/social context? (DCP agreed that it does not.) A: The APE covers the area that could be impacted by the project; it forms the limits for our analysis. - Q: Is there a separate involvement process for Section 4(f)? A: There is a public involvement element if these resources are affected. It isn't a committee, but there is a mechanism to gather input from agencies and others. - Kensington Park along the UPRR corridor should be added to the table on slide 29. *Note: information for Fernwood Parkway was included in the table although the name was mistakenly presented as "Fernwood Park" instead. Wendell-Smith Park is presented as "Smith Playlot" in the table, consistent with the Chicago Parks Department naming convention.*	CWC	3/1

Item No.	*Item Description*	*Responsibility*	*Due Date*
6	**Schedule & Next Steps** John Mettille reviewed the schedule and next steps. - Q: Can you describe the effects for each eligible property? A: We will cover this in the next phase of the process, probably in Spring 2013. - Q: What is the third alternative shown? A: The Halsted Alternative was added during the scoping process to look for options to minimize the impacts on parks and other 4(f) resources. The UPRR Alternative is the locally preferred alternative; we will define a National Environmental Policy Act (NEPA) preferred alternative as part of the NEPA process. - Q: Can the UPRR alternative fall anywhere inside the APE boundary? A: No, it will follow or run adjacent to the existing UPRR alignment. The APE includes a buffer to account for visual, noise, and other indirect effects. - Q: What source did you use for the architects and construction dates? A: CHRS and the County Assessor website. - Two of the photos on slide 26 could be considered contributing within a district. There are enough "Ranchalows" that they could be considered a housing style. The team will provide a full survey map and consulting party list as requested by attendees. Materials will be revised to clarify that properties referenced in Riverdale lie in the Riverdale Community in Chicago rather than Riverdale, Illinois. Please submit written comments on the eligibility materials by February 18.	CWC/CTA	2/6

Following the morning presentation, a number of attendees participated in a driving tour of the project area. Please notify Sonali Tandon of the minutes of any corrections and/or clarifications within five (5) business days.

cc: Attendees

Red Line Extension (RLE) Summary of Eligibility Comments received from Consulting Parties and Responses from Project Team

The following paragraphs briefly summarize comments received from the consulting parties on the eligibility of historic resources for the RLE Project and corresponding responses from the project team. Under the Section 106 consultation process, CTA undertook an extensive data collection and analysis effort during Fall 2012 to identify historic resources located within the Area of Potential Effect (APE) for the three built alternatives that are under evaluation in the RLE Draft Environmental Impact Statement (EIS). This analysis culminated in recommendations regarding the potential eligibility of historic resources pursuant to the National Historic Preservation Act of 1966. These recommendations were presented to the ten consulting parties, including the Illinois Historic Preservation Agency (SHPO), during a meeting on January 30, 2013. Participants were asked to provide relevant information from their perspective that may supplement the National Register of Historic Places (NRHP) evaluations contained within the RLE Draft EIS. Written comments were received from the following six organizations:

- Anne Haaker, Illinois Historic Preservation Agency
- Jennifer Kenny, Ridge Historical Society
- Jonathan Fine, Preservation Chicago
- Lisa DiChiera, Landmarks Illinois
- Matt Cole, Neighborhood Housing Services of Chicago
- Terry Tatum, Chicago Historic Preservation Division, Department of Housing and Economic Development

Based on local knowledge and input from the consulting parties, additional analysis was undertaken regarding historic resources within the APE. The original recommendations presented in January will be revised as described below and presented in the RLE Draft EIS. In addition to the written comments received by CTA, comments from the January 30 meeting will also be incorporated into the Draft EIS to provide additional clarification. Comments and responses are presented by general topic below.

Comments requesting additional surveys:

Several comments requested that the team evaluate additional sites for NRHP eligibility. These additional sites and their evaluations are summarized below, including both individual properties (Comments #1-6) and potential districts (Comments #7-12).

1. American Ideal Cleaning Building at 10343 South Michigan Avenue
   This building falls beyond the APE boundaries.
2. Lilydale Progressive Missionary Baptist Church at 10716 South Michigan Avenue
   This building falls beyond the APE boundaries.
3. Greystone building at 11445-11447 South Michigan Avenue
   This building falls beyond the APE boundaries.
4. Entrance gate and structure at Cedar Park Cemetery at 12584 South Halsted Street
   These structures were field surveyed in February 2013 and are recommended eligible for the NRHP under Criterion C for the high quality craftsmanship and unusual stonework. A site form is attached.

5. Kensington Park
The Park was field surveyed and, following archival research is not recommended eligible for the NRHP. Purchased by the City in 1942, Kensington Park has been updated throughout the decades and currently contains a number of contemporary recreational amenities that give it a recent appearance: a mid-twentieth century field house that is no longer in use, playground equipment, a splash pad, a paved basketball court, a horseshoe pit, and baseball fields. Although the field house is over 50 years in age, it lacks distinguishing architectural features. As a publicly-owned park, Kensington Park will be addressed in the NEPA document as a Section 4(f) resource.
6. Two-story commercial building at 11206 South Michigan Avenue
The building was surveyed and is not recommended eligible for the NRHP due to its lack of integrity and distinguishing architectural features. The site form is included on the Eligibility CD as 11200-11206 S Michigan Avenue.

Note: A number of sources consulted during the archival research phase – including the City of Chicago GIS database, Illinois Historic Preservation Agency's HARGIS database, County Assessor Records, and others – present building addresses inconsistently. Street numbers may differ by several addresses: the church at 12433-12439 South Halsted Street is called 12427 South Halsted Street by a different agency, though both refer to the same building. To aid comparisons, the summary table notes alternate addresses for several properties when these inconsistencies were identified during the eligibility assessments.

7. Potential historic district/grouping of cast stone-faced residences on South Eggleston Avenue between 111th & 112th Streets
Numerous buildings in this location were surveyed as part of the representative sample set, including one cast stone-faced residence on South Eggleston Avenue (11130 South Eggleston Avenue). Individually, this building was not recommended eligible for the NRHP due to its lack of integrity and distinguishing architectural features. Along South Eggleston Avenue near West 111th Street and West 112th Street, there appear to be only two cast stone-faced residences within the APE, which is not sufficient for these properties to be considered as a potential historic district or multiple property grouping.
8. Could groupings of ranchelows contribute to a future NRHP district (between 103rd St, 104th Pl, UPRR, and Princeton Ave)?
A number of raised ranches were surveyed as part of the representative sample set; none were found to merit individual listing for the NRHP. Although the area (between 103rd St, 104th Pl, UPRR line, and Princeton Ave) contains numerous residences with similar architectural styles, massing, setbacks, and construction dates, architectural historians confirmed that these properties do not retain sufficient integrity for the NRHP as a district due to contemporary - alterations (e.g., replacement siding, porches, windows, and doors). Numerous vacant lots and recent construction, such as the post-1980 Langston Hughes Elementary School that encompasses an entire city block, disrupts the visual cohesiveness of this area.
9. Potential district of Residential Railroad Suburbs or Historic Streetcar Communities, e.g. along the Chicago & Eastern Illinois RR; the Chicago & Great Eastern RR; the Illinois Central RR 121st Street spur; or streetcars along Michigan Ave, 103rd St, 111th St, 115th St, and 119th St.
After additional fieldwork, no cohesive groupings of historic commercial buildings or community centers were identified along the primary thoroughfares that supported streetcar lines, railroad

lines, or spurs. Therefore, the suggested areas are not recommended as a district or multiple property group.

10. Potential district/group of properties associated with the former Village of Fernwood, generally located between 90th St, 103rd St, Stewart Ave, and Morgan/Halsted Street
    As part of the original fieldwork effort, a handful of these resources were surveyed within the APE. As noted in the letter, many have integrity issues. Many of Fernwood's signature buildings are located outside the APE or have been demolished. Further, the amount of contemporary infill has compromised the historic setting of the residential suburb. Therefore, this area is not recommended as a district or multiple property group.
11. Potential district/group of historic automobile-related buildings along major thoroughfares (e.g. Halsted and Michigan Ave)
    Although a number of auto-related resources were surveyed within the APE, none exhibited sufficient historic integrity to qualify as eligible for the NRHP either individually or as a contributing resource within a multiple property group. All of the surveyed automotive service buildings exhibit contemporary alterations.
12. Chicago Georgian and Raised Ranch Historic Districts
    The Ridge Historical Society and other consulting parties suggested these styles be considered as part of the eligibility discussions for the Section 106 process. Review by architectural historians confirmed that a cluster of these properties exists along an approximately five block area on the east side of Green Street between 104th Street and 109th Street. The streetscape has a cohesive grouping of vernacular homes that is representative of residences that were constructed in the outlying areas of Chicago during the post-World War II era. Although such neighborhoods are common throughout the city, these five blocks include hipped-roof ranch homes, front-gabled cottages, and Chicago Georgian style homes with little to no contemporary infill. The residences date from the 1950s and 1960s with consistent setbacks and similar brick cladding; they appear to be well-maintained. Therefore, the portion of Green Street between 104th Street and 109th Street is recommended as eligible for the NRHP as a historic district for architecture (Criterion C).

Comments requesting reconsideration of surveyed properties:

Several comments requested that the team reconsider properties that were surveyed but recommended not eligible for NRHP listing at the January meeting. These additional properties and their evaluations are summarized below.

13. Sure-Way M.B. Church at the southwest corner of Halsted Street and 120th Street
    The building is not recommended eligible for the NRHP due to lack of integrity and because it no longer serves its original use. The site form is included on the Eligibility CD as 12000 S Halsted Street.
14. Fernwood Parkway
    Fernwood Parkway was evaluated against NRHP criteria and is recommended not eligible for NRHP listing. However, as a publicly-owned park, it will be addressed in the NEPA document as a Section 4(f) resource.
15. Roseland Auto Sales & Service at 11200 South Halsted Street
    The building is not recommended eligible for the NRHP due to its lack of integrity. The setting is compromised by contemporary infill and the exterior has been clad in modern materials. The site form is included on the Eligibility CD as 11200 S Halsted Street.

16. Bethany Reformed Church Manse at Three West 111th Place
    The building was not originally recommended eligible due to its lack of distinguishing architectural features. However, as a result of additional information provided by Ridge Historical Society, the resource is recommended eligible for the NRHP under Criterion B due to its association with Reverend Harry J. Hager (1899-1983), a pioneer in media evangelism in Chicago during the mid-twentieth century. A revised site form is attached.
17. Pridjian & Co Building at 11600 South Halsted Street
    The building is not recommended eligible due to its lack of distinguishing architectural features. While the Pridjian & Company business has been in operation for decades, the property does not reach the level of significance required by the NRHP. The site form is included on the Eligibility CD as 11600 S Halsted Street.
18. Roseland Community Hospital Nurse's Home at 11321 South Wentworth Avenue
    The building was surveyed and was not originally recommended eligible due to its lack of distinguishing architectural features. However, as a result of additional information provided by Ridge Historical Society during the eligibility discussions for the Section 106 process, the resource could be considered locally significant under Criterion A for Education based on its use as a dormitory for its nurses and as an important nurse training facility. A revised site form is attached.
19. Galloy & Van Etten Cut Stone Contractors Building at 11756 South Halsted Street
    The building was not originally recommended eligible under Criterion C due to its lack of integrity and distinguishing architectural features. However, as a result of additional information provided by Ridge Historical Society during the eligibility discussions for the Section 106 process, the resource could be considered locally significant under Criterion A for its longstanding association with the local construction industry as a 113-year old stone contracting company. A revised site form is attached.
20. Would the substation at 10227 South Halsted Street be eligible under Criterion A as well?
    Yes: the substation is recommended eligible under Criterion A for its association with utilities infrastructure within the city of Chicago. At the January 2013 meeting, it was recommended as NRHP eligible under Criterion C. A revised site form is attached indicating this building as eligible both under Criterion A and Criterion C.
21. Although noted architect Murray Hetherington designed the house at 11001 S Green Street, the resource was only evaluated based on its integrity.
    Numerous residences designed by Hetherington that exhibit greater integrity exist today, including 2078 West Hopkins Place, 8918 South Hamilton Avenue, and 8929 South Hamilton Avenue. Due to the compromised integrity of the Green Street property, it is not recommended as NRHP eligible. The site form is included on the Eligibility CD as 11001 S Green St.

Comments regarding assessment of effects:

The following comments expressed concern about the assessment of effects, which will be covered in the next phase of the consultation process. Noted below, these will be considered in the next phase of the analysis.

22. We object to historic properties being purchased and demolished for construction staging.
23. The proposed BRT route would affect the fewest cultural resources. The UPRR route will affect fewer resources than the proposed Halsted line.

24. Building an elevated rail line down Halsted Street would have negative consequences for the tranquil and bucolic atmosphere of the Cedar Park Cemetery.

Comments requesting minor amendments to the summary table and/or site forms:
The following comments identified minor amendments to the summary table and/or site forms for individual properties. None of these modifications change the NRHP eligibility recommendations. Noted below, these edits will be incorporated; revised materials will be provided along with the effects materials prior to the next phase of the consultation process.

25. The Fire Department Engine Co. 93 building at 324 West 104th Street (alternate address: 328-330 W. 104th St.) is CHRS Orange
26. The Roseland Pumping Station at 351 West 104th Street is CHRS Orange
27. The French Eclectic style house at 11310 South Emerald Avenue was listed as a "local landmark" but is not designated; it is CHRS Orange.
28. The Romanesque Revival style Church at 10920 South Princeton Street is CHRS Orange
29. The two-story commercial building at 11206 South Michigan Avenue is CHRS Orange
30. The architectural firm of Fox & Fox designed the church at 12433-1439 South Halsted Street, which was built in 1958-1959.
31. The Venetian Hall at 133-139 East Kensington Avenue was built in 1925-1926 and designed by Arthur F Hughes.
32. The house at 11310 South Emerald Avenue was built 1927-1928 for Stuart Colman. Inventory form should specify this resource is individually eligible.
33. Property listed as 748 East 103rd Street should be 748 West 103rd Street.
34. The substation at 10227 South Halsted Street was built in 1919-1920.

Other Comments:
Additional comments received are discussed below.

35. There should be a separate category in the spreadsheet for Chicago properties rated as "orange" on the Chicago Historic Resources Survey (CHRS).
    CHRS Orange properties were noted in the summary table provided to consulting parties on January 5, 2013. These properties will be discussed separately within the project's Environmental Impact Statement.
36. We [SHPO] generally concur with the findings of the architectural surveys. It is expected that additional resources suggested will be considered once the final route is selected.
    Comment noted.
37. While we agree that the house at 444 West 100th Place is NRHP eligible, we disagree about the Neo-Traditional style description and are concerned that the replacement of the original tile roof jeopardizes integrity.
    Based on the ornamentation (Neo-Gothic castellated porch roof, Classical colonettes, and arched lintels), the house was identified as an early example of the Neo-Traditional style. It is recommended as NRHP eligible and will be assessed for effects in the next phase of the consultation process.
38. Use of catch-all architectural style descriptors was inconsistent and difficult to sort/review.
    Many of the residential resources are stripped-down brick and frame bungalows and cottages representing the predominant building stock for the study area. Likewise, commercial resources

contain little ornamentation or detailing. The broad term “vernacular” was used whenever a resource did not exhibit a particular architectural style. This approach is consistent with the current state-of-the-practice.

39. Historic functions should match NRHP categories.
    While official NRHP functions were not used on the survey forms, easily identifiable equivalent terms were used to improve comprehension for a broader audience. This approach is consistent with the current state-of-the-practice.
40. Construction dates listed in the Cook County Assessor Records are less reliable than dates listed in building permit records.
    Numerous varied sources were used to establish and cross-check construction dates: County Assessor records, GIS database layers provided by the City of Chicago, the HARGIS database maintained by the Illinois Historic Preservation Agency, Sanborn mapping, etc. This approach is consistent with the current state-of-the-practice.
41. The church at 10920 South Princeton Avenue is currently called Mary Magdalene Missionary Baptist Church.
    The church at 10920 South Princeton Avenue was identified by both its historic name (First Christian Reform Church of Roseland) and its current name (Mary Magdalene Missionary Baptist Church) on the inventory form. The property is eligible for the NRHP due in part to its association with early Dutch settlement in the area, so the historic name was referenced in the presentation.

CTA
Red Line Extension

February 4, 2013

Sonali Tandon
Chicago Transit Authority
567 W. Lake St.
Chicago, IL 60661-1498

Dear Ms. Tandon:

Thank you for requesting comments from our office concerning the possible effects of the referenced project on cultural resources. Our comments are required by Section 106 of the National Historic Preservation Act of 1966, as amended, and its implementing regulations, 36 CFR 800: "Protection of Historic Properties".

We appreciated information provided during the meeting at the CTA on January 30, 2013, and the tour that augmented the architectural surveys and introduced the three routes proposed by the CTA. In general we concur with the findings of the architectural surveys submitted to this office prior to the meeting and tour, but during the tour is was noted that resources identified on the Chicago Historic Resources Survey were not identified and that structures such as those located within Cedar Park Cemetery were excluded from the sample. It is likely that our preservation partners present at the meeting will have additional resources that they would like to see included in the survey. It is expected that these additional resources will be considered once a final route has been selected.

In our opinion, the proposed expansion of the BRT route will affect the least amount of cultural resources located within its APE. We also believe the UPRR route that is often adjacent to existing railroad tracks will affect fewer resources than the line proposed on Halsted Street.

We look forward to reviewing the final historic resources report once the comments of our preservation partners have been considered.

If you have questions please contact David J. Halpin, Cultural Resources Manger, at 217-785-4998.

Sincerely,

Anne E. Haaker

Subject: Red LIne Extension Section 106 - comments on historic resource identification

Dear Ms. Tandon:

Thank you for the opportunity to comment on historic resource identification efforts for the Red Line Extension Project as part of the ongoing Section 106 consultation process for this project. Our office appreciates the scale and importance of this undertaking, and we commend the CTA's efforts to incorporate historic preservation issues and concerns into its larger planning efforts. We hope to work with you to minimize the effect of the Red Line Extension Project on historic properties.

As part of the Section 106 process, we wish to bring to your attention both general observations on this historic resource identification effort, as well as comments on specific properties that may be impacted by the project.

Chicago Historic Resources Survey red- and orange-rated properties

With the help of your consultant team, you have preliminarily identified properties that are eligible for NR listing. These properties have been listed in the "RLE Draft Eligibility Findings for Surveyed Properties" spreadsheet.

Our office believes that there should be a separate category in the spreadsheet for Chicago properties rated as "orange" on the Chicago Historic Resources Survey. (There are no CHRS "red-rated" buildings in the Red Line Extension's APEs.) Conducted between 1983 and 1995, this city-wide survey identified properties constructed prior to 1940 that were perceived to have, within at least the context of their neighborhoods, some historic significance to these neighborhoods. These buildings were either color-coded red or orange, depending upon the level of their historical and architectural significance as known at the time of the survey.

Although not designated Chicago Landmarks, these CHRS "red" and "orange"-rated properties are covered by the City's Demolition-Delay Ordinance, enacted by City Council in 2003, which allows for an up-to-90-day hold on building permit applications for demolition by the Department of Housing and Economic Development (DHED) for these properties. (More information on this ordinance can be found at http://www.cityofchicago.org/city/en/depts/dcd/supp_info/demolition_delay.html.) Even where such properties have also been determined eligible for National Register listing, we believe that it is prudent of the CTA to separately identify all CHRS orange-rated properties within the APEs on the historic resources spreadsheet. The effect of the Red Line Extension Project on these "orange" properties can then be determined and, if necessary, mitigated through direct discussions with DHED as early in the project as possible.

Observations concerning individual properties located in the APEs

1. Several buildings identified as "orange-rated" in the Chicago Historic Resources Survey (CHRS) were sampled by the CTA's historic resources consultants.

The **Classical Revival substation** at 10227 S. Halsted St. (Map 7) was determined eligible for National Register listing. It is a CHRS "orange-rated" building and was noted as such on the spreadsheet.

The **Fire Department Engine Co. 93 building** at 324 W. 104th St. (alternate: 328-330 W. 104th St.) (Map 30) was preliminarily determined eligible for National Register listing. It is a CHRS "orange-rated" building, but was not noted as such on the spreadsheet. It should be so noted.

The **Roseland Pumping Station** at 351 W. 104th St. (Map 30) was preliminarily determined eligible for National Register listing. It is a CHRS "orange-rated" building, but was not noted as such on the spreadsheet. It should be so noted.

The **French Eclectic style house** at 11310 S. Emerald Ave. (Map 12) was listed as a "local landmark" and preliminarily determined eligible of NR listing. However, it is not a designated Chicago Landmark. Instead, it is an "orange-rated" building in the CHRS, but was not noted as such on the spreadsheet It should be so noted.

The **Romanesque Revival style Church** at 10920 S. Princeton St. (Map 34) was preliminarily determined eligible for National Register listing. It is a CHRS "orange-rated" building, but was not noted as such on the spreadsheet. It should be so noted.

2. In addition, one building identified as "orange-rated" on the CHRS and located within the APE for the BRT option was not identified and sampled. The **two-story commercial building** at 11206 S. Michigan Ave. (listed as 11208 S. Michigan on Map 45) was not sampled by the historic resource survey. It is an "orange-rated" building in the CHRS (CHRS data form and Google Earth photo attached) and should be noted as such on the spreadsheet. It should also be separately evaluated for National Register eligibility.

I would be pleased to assist the CTA's consultant team as they gather additional information on historic resources within the APEs for this project.

Sincerely,

Terry

RE: Red Line Extension– NR eligible properties in APE

Dear Ms. Tandon,

As requested, we have reviewed the APE boundaries and the properties identified within the APE that are listed in or "eligible" for listing in the National Register of Historic Places by the Red Line Extension project team.

We are very pleased to see the numerous properties identified and acknowledged as historic. However we have the following observations:

- We recommend including all properties that are orange-rated in the Chicago Historic Resources Survey (CHRS) in a separate category due to the fact that they will require an additional mitigation process through the city's demolition delay ordinance.
- During the driving tour of the preferred Red Line Extension routes, I took note of the following properties that were not included in the project team's list of eligible properties that looked as if they could be of possible architectural significance.
    - The American Ideal Cleaning Building at 10343 S. Michigan – a mid-century commercial building
    - The Lilydale Progressive M.B. Church at 10716 S. Michigan
    - City Sports store commercial block at 11102 S. Michigan
    - 11445-47 S. Michigan – Commercial/residential side by side Greystone – rated orange in CHRS
    - 11451 S. Michigan – one story commercial Art Deco building – rated orange in CHRS
    - Sure-Way Missionary Baptist Church at S.W. corner of Halsted and 120th. Art Deco corner building with a mid-century addition on the south side
    - Entrance gates and structure to Cedar Park Cemetery, 12584 S. Halsted
- Based on precedent with the Brown Line renovation project, we object to historic properties being purchased and demolished to make way for construction staging. We hope the team will specifically identify historic properties in the areas where construction staging may be planned to help identify alternative locations.

Thank you for the opportunity to review the findings by your team for this project. Please let me know if we can be of further assistance before the next consultation.

Sincerely,

Lisa DiChiera

RE: Red Line Extension – National Register eligible properties in APE

Dear Ms. Tandon,

As a housing and community development organization with longstanding ties to the greater Roseland area, we appreciate CTA inviting Neighborhood Housing Services of Chicago, Inc. (NHS) to participate in the Section 106 review for the proposed Red Line Extension routes. NHS believes the Red Line Extension project will ultimately enhance the livability and well-being of Roseland and surrounding neighborhoods by increasing transit access for residents. At the same time, we wish to ensure that the project minimizes any undue impacts on the existing residential, community, and historic buildings that make these neighborhoods great and that our experience has shown can be important community-building and engagement assets. Therefore, NHS would like to submit the following comments regarding the National Register eligible properties surveyed by the Red Line Extension project team in the APE:

- We recommend re-evaluating the exclusion of raised ranches – colloquially referred to "ranchelows" for looking like a cross between a Chicago bungalow and a ranch-style home – from the survey. While currently not a formally recognized form of Chicago vernacular architecture, these homes define the look and character of large stretches of the APE adjacent to UPRR right-of-way. We would encourage the CTA project team to determine if groupings of "ranchelows" in the APE could contribute to a future National Register district.
- During the van tour of the preferred Red Line Extension routes on January 30th, we also took note of the following areas that warrant additional surveying/review by the project team:
    - 111th & 112th South Eggleston: A few cast stone-faced residences were observed on or adjacent to these blocks, including one home immediately adjacent to the UPRR right-of-way. These buildings, which look similar to Chicago greystones, are relatively rare and should be evaluated for National Register eligibility.
    - 103rd Street to 104th Place between the UPRR and Princeton Avenue: This area includes the previously identified, National Register-eligible Roseland Pumping Station and Roseland Fire Station properties. However, the blocks also include a largely intact and well-maintained grouping of Chicago bungalows and frame

  cottages. We would encourage the project team to conduct a more detailed survey of these blocks to determine if these residential properties could contribute to a future National Register district.

  - Though not directly applicable to the survey of National Register-eligible properties, we encourage the project team to carefully evaluate the potential impact of the Red Line Extension on the Fernwood Parkway that runs immediately west of the existing UPRR right-of-way. Albeit simply landscaped, the parkway provides a nice amenity to homes along Eggleston Avneue between 99th and 104th Streets.

In addition to these observations, we fully concur with the recommendations from Lisa DiChiera, Director of Advocacy, at Landmarks Illinois regarding specifically calling out "orange-rated" properties listed on the Chicago Historic Resources Survey; the additional commercial, religious, and community buildings that should be evaluated on Michigan Avenue and Halsted Street; and avoiding the demolition of any historic properties to make way for construction staging.

Thank you again for inviting NHS to participate in the Section 106 review for the Red Line Extension project. Please let us know if we can be of further assistance before the next scheduled consultation.

Best,

Matt Cole

Re: Red Line Extension – Possible negative effects to historic properties with in the proposed APE

Dear Ms. Tandon,

Thank you for facilitating the recent driving tour of the three proposed routes for the Red Line extension. I am writing in response to concerns our organization has regarding possible destruction of historic buildings or landscapes with the APE.

I have had a chance to review the comments being submitted by Landmarks Illinois and we agree with and support all of their concerns.

In addition, we are concerned about the negative consequences that building an elevated rail line down the middle of South Halsted Street would have on the tranquil and bucolic atmosphere of Cedar Park Cemetery.

Thank you for your consideration. We look forward to continuing our partnership on this exciting project.

Sincerely,

Jonathan Fine

Sonali Tandon
Chicago Transit Authority
567 West Lake Street, 10th Floor
Chicago, IL 60661

Dear Sonali,

Thanks for the opportunity to be a consulting party to the CTA's Red Line Extension (RLE) Section 106 eligibility process.

The Ridge Historical Society (RHS) serves the Beverly, Morgan Park and Washington Heights community areas on Chicago's south side. For this reason, we are particularly interested in the RLE impact upon historic properties in the APE situated within the Morgan Park and Washington Heights community areas. Both the Halsted Street and Union Pacific Railroad APE are located at the easternmost boundary of our service area. Please note that we do maintain an archival collection that reaches beyond our service area since our history does overlap with nearby areas, including West Pullman and Roseland. We reserve the right to comment on historic resources in other community areas just outside of our service area.

I have reviewed the materials and inventory forms submitted by the consulting team and offer the following comments.

IDENTIFIED NR ELIGIBLE PROPERTIES

The Ridge Historical Society agrees with the National Register (NR) eligibility of the two properties identified by the study in the Washington Heights community areas (our service area) – 10227 S. Halsted Street and 444 West 100th Place. Unfortunately, the team did not identify any NR eligible properties in the Morgan Park community area.

1. We agree that the City of Chicago Department of Gas and Electricity, Southwest Substation, at **10227 South Halsted Street** is NR eligible under C for its architecture, as a rare remaining example of a city government public works building. As stated on the study's inventory form, it is an orange rated building in the Chicago Historic Resource Survey (CHRS). The CHRS did supply a date of construction, 1919-20, that does not appear on the inventory form. I am wondering if this public works building is also NR eligible under A.
2. We agree that the single family dwelling at **444 West 100th Place**, built 1931, is potentially NR eligible under C for its architecture, as a rare brick Bungalow in

Washington Heights with striking Tudor Revival and Mediterranean Revival detailing. The Bungalow sports a handsome crenellated entry, decorative arches, and colonettes. I would not call this building Neo-Traditional, which is an architectural style reserved for late 20th-century buildings. I am concerned that this home once had a clay tile roof, perhaps jeopardizing its integrity. A similar house, designed by architect John Hoche, can be found in Beverly at 1762 W. 94th Street.

Additionally, I am providing architectural and historic info on other properties in the APE flagged as NR eligible by the team:

- The architectural firm of Fox and Fox designed S. S. Peter and Paul Church, **12433-12439 S. Halsted Street**, 1958-59. Architect John J. Fox, Jr. was a longtime resident of Beverly-Morgan Park and a noted local Roman Catholic church designer. He died in 2003.
- Venetian Hall, **133-139 E. Kensington Avenue**, was built in 1925-26 and designed by architect Arthur F. Hughes. Hughes is a local architect who designed a number of striking historic revival style homes in Beverly-Morgan Park.
- **11310 South Emerald Avenue** was built in 1927-28 for owner Stuart Colman. Note: the Individually Eligible category on page 2 of the inventory form says No when it should say Yes.

ADDITIONAL INDIVIDUAL PROPERTIES THAT MAY BE POTENTIALLY ELIGIBLE FOR THE NATIONAL REGISTER OF HISTORIC PLACES

The Ridge Historical Society would like the team to consider the following buildings for NR eligibility:

Roseland Auto Sales and Service Building (Allinone Auto Sales Building)
11200 South Halsted Street (Morgan Park)
Built 1927 for Henry T. Vollmer
Doerr, Lindquist and Doerr, architects

Potentially eligible under Criterion C for architecture as a rare remaining example of a garage and auto sales building from the early 20th-century in Morgan Park. Both Beverly-Morgan Park and Roseland were once major centers of auto sales on Chicago's south side, with dealerships along major area thoroughfares. Building is best known historically as a satellite salesroom for Roseland Auto Sales, featuring Studebakers. Additionally, Midland Terra Cotta Company provided the handsome terra cotta ornament for the one-story brick store building. Its integrity was likely questioned by its wood paneled storefront, but the original storefront may be behind the vertical boards If not individually eligible, perhaps eligible as part of a multiple property listing (see below).

Bethany Reformed Church Manse
3 West 111th Place
Craftsman-style single family residence
Built 1923-24
Purchased by church and addition built in 1928

Potentially eligible under criterion B for its historic associations with Reverend Harry J. Hager, pastor of Bethany Reformed Church from 1929-1975. Hager was a pioneer in media evangelism in Chicago during the mid 20th-century through his Sunday radio ministry broadcasts on local stations WHIP and WCFL. This church-related residence in the Craftsman style retains a high degree of architectural integrity, including a Gothic Revival style entry porch that likely dates to Hager's residency.

K. A. Pridjian and Company Building
11600 South Halsted Street
Built 1960

Potentially eligible under Criterion A for its historic associations with longtime local business, K. A. Pridjian and Company, Rug Cleaning and Sales. Established in 1924 in Roseland, Pridjian first operated at 54 West 111th Street. Owner K. A. Pridjian (d. May 6, 1965) had the facility built specially for his rug operation. Building retains much of its integrity in its mid-century storefront design, materials, and signage. (side note: Almost everyone in Beverly-Morgan Park has their rugs cleaned by Pridjian!)

Roseland Community Hospital Nurses Home
11321 South Wentworth Avenue
Built 1923-24
E. Hall, architect.

Potentially eligible under Criterion C for its architecture as a rare remaining example of a unique education-related building type in Chicago, a hospital-affiliated nurses' home. The three-story brick, Roseland Community Hospital Nurses' Home provided housing and educational opportunities for women training in the nursing profession. The interior may still reflect dormitory rooms, classrooms, and other spaces essential for nurses' training during the early 20th-century. Not sure how many of these building types are left in Chicago, but might be one of the only on the south side.

Galloy and Van Etten Cut Stone Contractors Building
11756 South Halsted Street
Built over time – 1921, 1928, 1946 and 1950

Potentially eligible under Criteria C for its associations with the Van Etten family, prominent local builders on Chicago's south side. Galloy and Van Etten, a longtime cut stone contracting business near the Panhandle railroad tracks, has operated continuously at this site from at least 1909. The cut stone exterior of the buildings within the complex reflects its occupant's trade. Founder Abe Van Etten was the brother of Simon and Henry Van Etten, whose contracting firm known as Van Etten Brothers built monumental residences and religious buildings on the south side. Galloy and Van Etten likely provided the cut stone used in many of these buildings.

NR ELIGIBLE CONTIGUOUS HISTORIC DISTRICTS OR MULTIPLE PROPERTIES

The Ridge Historical Society urges the team to revisit any groupings of historic properties that may be potentially NR eligible as contiguous districts or as multiple property listings The APE is located in a section on Chicago's south side that has been under surveyed in the past, and as a result, little data is available and very few historic resources have been proactively designated as local landmarks or listed in the National Register of Historic Places. Perhaps our community areas need a different approach in this type of study, especially when conducting cultural resource surveys. For example, surveyors could relax harsh integrity standards or look at broader patterns that might lead to multiple property nominations.

Here are some suggestions:

1. Would any of the Historic Residential Railroad Suburbs or Historic Streetcar Communities in the APE be NR eligible as multiple property listings? Since suburban development was extensive outside of nineteenth-century Chicago, perhaps the team could take a second look at the communities that were stimulated and developed along the area's railroads and streetcars in 19th-century Calumet Township and Chicago's early 20th-century neighborhoods. Especially important are those along the Chicago and Eastern Illinois, which came through in 1880-81 (UPRR APE); the Chicago and Great Eastern Railroad, an early subsidiary of the Pittsburgh, Cleveland, Chicago and St. Louis Railway who constructed tracks in 1865 (Halsted APE); and the Illinois Central Railroad who operated an east-west spur at 121st Street. Streetcars were operating along Michigan Avenue, 103rd Street, 111th Street, 115th Street and 119th Street, and stimulating residential and commercial development.

   Properties Associated with the former suburban Village of Fernwood. Fernwood is now part of the Washington Heights community area and within the RHS service area.

   Fernwood, a station stop on the Chicago and Eastern Indiana Railroad was first incorporated as a village in 1886 and annexed to the City of Chicago in Spring of 1891. Focused on a station at the 103rd Street crossing (then Tracy Avenue), Fernwood was mostly a residential district, with a few locally serving commercial buildings. Its boundaries ran from 90th Street on the north, 103rd Street on the south, Stewart Avenue on the East, and Morgan and Halsted on the west. Developers E. L. Gillette and Henry L. Hill, along with S. Montgomery Smith, laid out Fernwood in 1883 for residential development with an adjacent public park, approximately 75 feet wide along the tracks from 99th Street to 103rd Street. This park, now known as Fernwood Parkway, played a significant role in the development of this railroad suburb. This landscape feature marks the importance of open space, trees, and grassy public space to a growing residential suburb. Within the APE, a number of frame homes on suburban size lots remain, particularly along Eggleston Avenue, representing this period of development. Yet, these residences may have integrity issues (see 10100 South Eggleston Avenue), and many of Fernwood's signature buildings are either outside of the APE (including churches and a public school) or have been demolished (such as the Fernwood Station and Gillette Hall).

2. **Historic automobile-related buildings along major thoroughfares, including service stations, garages and car sales dealerships**. In reviewing the inventory forms in the APE, the team recorded a large number of auto-related buildings, although not contiguous. Halsted Street and Michigan Avenue were both major thoroughfares for the area, and as stated above, both Beverly-Morgan Park and Roseland were once major centers of auto sales on Chicago's south side. Could these buildings be NR eligible as a multiple property nomination?

3. **Chicago Georgian and Raised Ranch Historic Districts**. Just like the Chicago Bungalow Multiple Property Listing and subsequent NR districts, perhaps a multiple property listing is imminent for neighborhoods of Chicago Georgians and Raised Ranches. Both are mid 20th-century vernacular types which evolved from the earlier designs and plans of the American Foursquare and Bungalow respectively. Rows of raised ranches (also known as Bungalow Ranches) are found in the Halsted APE.

GENERAL COMMENTS AND CORRECTIONS:

1. Usage of catch-all architectural styles and types. Most every building I reviewed was labeled vernacular. Architectural styles, when used, were inconsistent. Using catch all categories makes it quite difficult to sort, review and compare important architectural specimens. Upon request, I can provide corrections to architectural styles and types in the Washington Heights and Morgan Park community areas.
2. Historic and current functions and uses should match National Register categories.
3. Construction dates for historic buildings in the APE came from an unreliable source–Cook County Assessor lists. A better primary source, such as City of Chicago building permit records, should be used for those properties determined NR eligible. It is disappointing that the team did not conduct basic research on the very small number of buildings (9) determined eligible in the study under NR Criterion C for architecture. Construction dates, owners, architects and builders would surely add to the historic context and story.

4. 748 E. 103rd Street (Washington Heights) should be **748 W. 103rd Street**.
5. Noted Beverly-Morgan Park architect Murray Hetherington designed the Tudor Revival-style residence at **11001 South Green Street** (Morgan Park), built 1940-41. Although a handsome, small scale Tudor Revival house, strict integrity standards were applied by the team.

Please contact me with further questions.

Sincerely,

Jennifer R. Kenny

PREPARED BY: Rebecca Thompson

ISSUE DATE: June 6, 2014

Meeting called to order at 10:00 am CT

Objective: Red Line Extension Effects Meeting for Section 106 Consultation

Item No.	*Item Description*
1	**Welcome/Intro** Mike Connelly welcomed attendees. JM reviewed the agenda and informed attendees that a public Open House is scheduled for May 13.
2	**Review of Project and Previous Section 106 Tasks** ST explained the overall purpose of the project and alternatives. JM provided an overview of the four-step Section 106 process, which is intended to assess project effects on historic resources (those previously identified as eligible for National Register of Historic Places [NRHP] listing). JM identified ground rules and reviewed previous coordination efforts undertaken to date as part of the Project. In response to comments received after the eligibility consultation in January 2013, Kensington Park was surveyed but was not recommended as eligible. Six potential historic districts were suggested; Green Street is recommended as eligible. Nine individual resources were suggested for reconsiderations. Of these, four resources are recommended as eligible based on supplemental information.
3	**Overview of Alternatives** JM presented an overview of the four alternatives that will be evaluated in the EIS: No Action, Bus Rapid Transit (BRT) along Michigan Avenue, the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Rail Alternative. - Q: Is the BRT park-and-ride lot on the north side of 130th Street? A: Yes. - Q: Why are the garages shown as three levels? As shown, it looks like a huge impact on Altgeld Gardens. A: Preliminary ridership analysis indicates park-and-ride demand, which is why we are proposing such large structures. As we fine tune the design moving forward, we'll re-evaluate the garage sizes and incorporate some urban design elements to mitigate the impact. - Q: How many properties would be removed along the Halsted route? A: We'll discuss this at the individual community meetings and Open House. The focus of this meeting is effects on historic resources. - Q: Are the piers for the Halsted line in the sidewalk or street? A: That will be determined in future engineering phases. The straddle bent piers could encroach into the parking lane. - Q: Would the Halsted piers have a similar placement to the structure at the Morgan/Lake? A: Halsted Street has two travel lanes and a parking lane in each direction and is wider than the configuration at Lake Street. The pier type chosen will make a difference on placement too. There could be impacts on parking spaces. *Follow up note: All traffic impacts would be covered in the Transportation section of the Draft EIS.* - Q: How high is the structure along Halsted? A: It varies – roughly 23-30 feet above ground level; the necessary height is determined based on the street clearance requirements. - Comment: In talking with business owners at Galloy & Van Etten Stone Contractors, they are worried about their large trucks being able to access their sites.
4	**Section 106 Effects on National Register of Historic Places Eligible Resources** The team developed effects recommendations based on the conceptual alternatives described previously. JM stepped through each resource. The criteria for determining effects are defined in 36 CFR 800.5. For the three options of Union Pacific Railroad (UPRR) Alternative, the team examined the option that is closest to the historic resource, to represent the worst case analysis. - Q: Will you be sending a copy of the slides? A: The Effects Report provides general information and distances and CTA will have additional

Item No.	Item Description
	boards at the Open House, which will also be posted on CTA website. The effects slides contain preliminary deliberative materials so CTA will not be circulating copies. - Comment: The Cottage/Bungalow District that Neighborhood Housing Services of Chicago (NHS) commented on in the eligibility comments shows up in the map near the Pump Station. - WM: How close is the East Option UPRR track structure to the Pumping Station? A: It is close and almost adjacent– we'll have to look it up. *Follow-up note: Horizontally, it is about 8.8 feet between the pump station and track structure in the UPRR East Option. However this distance is based on conceptual engineering and can change slightly as additional detailed engineering is performed.* - Comment: If there is a future expansion along the UPRR line, we want to be sure that there is ample room to accommodate it. It would be good if the alternative were further from the building; I question whether it is actually a "No Effect" as shown. Response: It is a tight site at the Pumping Station. We are required to be outside of UPRR right-of-way. - Q: Does the analysis include staging areas as well? A: Yes. These are included in the footprints. - Q: How tall is the BRT garage by the Venetian Hall? A: 2 stories *Correction: it is 3 stories with some space for retail and community facilities at ground floor.* - Q: Are there any buildings in the footprint of the proposed garage? A: We looked at all the potential displacements associated with each alternative. There are no structures within the garage footprint that would be displaced. - Q: Is it a possibility to adopt/restore the Venetian Hall as part of the adjacent garage? Or incorporate similar elements in the garage design? A: If there is an adverse effect, we will try to mitigate that. We will look at improving the view of the garage and making it more street friendly. CTA can take this under consideration. - Q: NHS' eligibility comments included the cast masonry structures, one of which appears immediately south of the Venetian Hall. What was the determination there? A: Those were determined non-eligible; several were surveyed and lacked integrity and/or distinguishing architectural features. There wasn't a cohesive grouping either. - Q: What is the building across from the garage, next to Altgeld Gardens? A: There is a park; the buildings next to the park may be part of Golden Gate. - Q: What is the station like for UPRR at the west option? A: Trains stop, unload/load, and turn back. There is no yard or additional tracks at this location – the yard is proposed further north at 120th Street. - Comment: The garage could have a visual impact. Nothing else nearby is built at that scale/height. There may be an impact on the Altgeld Garden Historic District, which will likely gain historic significance into the future due to its association with President Obama. CTA should consider a more modest garage design. - Comment: Several parties would like to see a view of the West Terminal station option from directly across 130th Street at Altgeld. Response: Early communications with community members indicated a local preference for the South Station option, which would have an entrance south of 130th Street. - Comment: Both 130th UPRR station options need further study – there will be impacts to transportation, people's homes, etc. *Follow-up note: All other impacts will be discussed in the Draft EIS.* - Q: How difficult is it to cross from the south station to Altgeld or Philip Homes? A: 130th Street is on a viaduct that allows the tracks and platforms to extend under 130th Street. You wouldn't have to cross 130th Street to get to the Station, only a local street. - Q: Are the viaducts safe for travel?

Item No.	***Item Description***
	A: Vehicles travel on the 130th Street viaduct today. - Q: Will a station include CTA/CDOT landscaping improvements to link to Altgeld? A: Definitely. A study was conducted focusing on access and connectivity at 130th Street Station. CTA has coordinated and will continue to coordinate with CHA to integrate plans. - Comment: At the Green Street Historic District, track structure will certainly be visible and audible. - Q: What level of noise impacts are anticipated along Green Street? A: Noise mitigation measures (e.g. noise walls, closed deck, etc.) have been incorporated into preliminary designs to mitigate impacts. *Follow-up: Based on the general level noise analysis conducted per FTA guidance, the Green Street Historic District lies at the edge of the moderate noise impact zone, assuming the project includes 3-4 foot high noise barriers and a closed deck structure. Historic experts will reexamine potential effects on the Green Street Historic District.* - Comment: I think property owners who live within the Green Street Historic District would be adversely affected by the Halsted Alternative. Response: That will definitely be looked at as part of the National Environment Policy Act (NEPA) analysis. - Comment: As you look at this more, it would be nice to have a rendering showing how close the tracks are and what the relationship will look like between the Halsted line and Green Street district. - Comment: The former substation is city-owned and vacant. Consider incorporating it into the station. Maybe it could be an entry point. This provides a good opportunity to give back to the community by adopting some of the Chicago Historic Resources Survey Orange buildings, similar to measures at the Wilson station. - Comment: The French Eclectic House would experience the same impacts as Green Street. There are several nice homes within this block, possibly nicer than the resources along Green Street, though they lack the consistency of Green Street. Scale and noise will be issues. These areas could be negatively impacted, driving people to move out of the area. - Comment: Galloy and van Etten is a family business and has been in the area since 1899. Photos show the building dating to 1909; it is a huge resource for the area. The business owner feels like they would be so adversely affected by the Halsted Alternative that they would have to relocate. It is a fourth generation family-owned business and provides a lot of employment. They are also concerned about the proximity to the 119th Street yard. - Comment: A lot of businesses are within the 119th Street yard. It used to feed all of Roseland with jobs. Many of the buildings have been demolished but some are left and could be negatively impacted. Response: CTA is coordinating with Far South Community Development Corporation regarding potential impacts on businesses. - Comment: Several consulting parties requested renderings for the four adversely affected resources along Halsted. - Q: What about impacts on the rest of the cemetery? A: Only the gatehouse/entryway is considered eligible. Comment: The impacts on the cemetery will be assessed as part of NEPA analysis. - Q: Is the fire station within the rail yard still accessible? A: Yes. - Comment: By placing the tracks so close to the resource, are you precluding future viability of the resource to function? This is an issue at the fire station and the St. Peter & Paul Church in particular. TT: The fire station’s current location isn’t particularly viable as it is today. Perhaps relocating this building should be a consideration as part of mitigation, although we don’t typically like to

Item No.	*Item Description*
	move structures. The fire station would be more viable on an arterial. The trend city-wide has been to close a number of these smaller structures. - Comment: We've heard some good ideas regarding mitigation, but there are a few steps between now and then. We still have to have a selected alternative before developing detailed mitigation measures.
5	**Schedule and Next Steps** There is an open house next week. A Draft EIS is being prepared, which will include additional analyses and public involvement opportunities. - Q: When would a single preferred alternative be selected? A: The Final EIS would be prepared on a single alternative. - Q: Is there a way to understand whether any of the resources we identified in the eligibility phase that were not determined eligible would be affected? A: They were not examined as part of this analysis since we evaluated only eligible buildings or districts for Effects determination. - Comment: Please resend the responses to eligibility comments.

Please notify ST of any corrections and/or clarifications to the minutes within five (5) business days.

cc: Attendees

Red Line Extension (RLE) Summary of Effects Comments received from the Consulting Parties and Responses from the Project Team

The following paragraphs briefly summarize comments received from the consulting parties regarding the project effects on historic resources for the RLE Project and corresponding responses from the project team. Under the Section 106 consultation process, the Chicago Transit Authority (CTA) undertook an extensive data collection and analysis effort during fall 2012 to identify historic resources located within the Area of Potential Effect (APE) for the three build alternatives that are under evaluation in the RLE Draft Environmental Impact Statement (EIS). This analysis culminated in recommendations regarding the potential eligibility of historic resources pursuant to the National Historic Preservation Act of 1966. These recommendations were presented to the ten consulting parties, including the Illinois Historic Preservation Agency (IHPA), during a meeting on January 30, 2013. Input from consulting parties was considered throughout 2013, resulting in 13 individual properties and two historic districts being identified as eligible under the National Register of Historic Places (NRHP) criteria.

Following this step in the consultation process, CTA undertook an analysis of effects on NRHP-eligible historic properties in accordance with criteria established in 36 CFR 800.5. This analysis culminated in recommendations regarding the potential effects on historic resources, which were mailed to consulting parties on April 18, 2014, requesting any written comments by May 23, 2014. An in-person meeting was conducted on May 8, 2014 to discuss these recommendations. Participants were asked to provide relevant information from their perspective that may supplement the effects recommendations summarized in the April 18 packet. Written comments were received from the following four organizations:

- Anne Haaker, Illinois Historic Preservation Agency (IHPA)
- Lisa DiChiera, Landmarks Illinois
- Matt Cole, Neighborhood Housing Services of Chicago
- Terry Tatum, City of Chicago, Department of Planning and Development, Historic Preservation Division

Comments and responses are presented by general topic below. Based on local knowledge and input from the consulting parties, additional analysis was undertaken regarding historic resources within the APE. The original recommendations presented in April/May 2014 will be revised as described below and presented in the RLE Draft EIS.

The CTA announced on August 10, 2014 that as part of its planning process to extend rail service to 130th Street on the far South Side, it has narrowed down the alternatives to two preliminary options for the proposed RLE Project. Based on feedback received from the public this spring and summer via community meetings and comments provided to the agency, the CTA is now focusing on one "preferred alternative" with two possible variations from the three build alternatives that have been under consideration. The CTA believes these options would best serve communities and residents on the Far South Side:

≠ Union Pacific Railroad Rail (UPRR) Alternative, East Option. Under this option, CTA tracks would be placed immediately east of the Union Pacific railroad right-of-way from 99th Street to 118th Street

- UPRR Alternative, West Option. Under this option, CTA tracks would be placed immediately west of Union Pacific's right-of-way from 99th Street to north of 118th Street.

The proposed alignment of the rapid transit line would be the same for the two East and West options north of 99th Street and south of 118th Street.

Eligibility Reconsideration Requests

1. Resurvey the grouping of Chicago bungalows and frame cottages at 103rd Street to 104th Place between the UPRR line and Princeton Avenue.
   Nine resources (Chicago bungalows and frame cottages) were surveyed as part of the representative sample of surveys. Although the area contains numerous residences with similar architectural styles, massing, setbacks, and construction dates, architectural historians verified that these properties do not retain sufficient integrity for the NRHP as a district due to contemporary alterations (e.g., replacement siding, porches, windows, and doors). None were found to merit individual listing for the NRHP due to their integrity. Numerous vacant lots disrupt the visual cohesiveness of this area. Despite the general consistency in property types, the collection of bungalows and frame cottages is broadly representative of residential areas on the South Side, lacking the distinguishing elements to qualify as NRHP eligible. Please refer to forms 301, 306, 321, or 326 W 103rd Place; 262, 328, or 335 W 104th Place; or 310 or 325 W 104th Street on the Eligibility DVD provided to consulting parties on January 4, 2013 for specific examples.

2. Reconsider eligibility determinations for cast stone-faced residences adjacent to the UPRR right-of-way, including the property adjacent to the Venetian Hall.
   The properties adjacent to the Venetian Hall are a brick two-flat (129 E Kensington Ave on southwest side) and a vinyl-clad multi-residence (141 E Kensington Ave on the east side). Neither building exhibits distinctive architectural features or sufficient integrity for inclusion on the NRHP. Likewise, the two cast stone-faced houses facing the Venetian Hall (122 and 136 E Kensington Ave) do not feature distinctive architectural elements or sufficient integrity for inclusion on the NRHP. Architectural historians verified that these properties do not retain sufficient integrity for the NRHP due to contemporary alterations (e.g., replacement porch, windows, and doors), compromising the historic materials and workmanship. No cohesive set of similar properties has been identified in the vicinity that would merit consideration as a potential historic district or multiple property grouping.

3. Reassess the area around 111th Street at Emerald Avenue for a potential district.
   CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. The area around 111th Street at Emerald Avenue is distant from the UPRR Alterative corridor and would not be affected by the RLE Project.

Effects Reconsideration Requests

4. Reevaluate the visual, noise, and economic effects of the Halsted Alternative on the Green Street Historic District, which could have a significant impact on the quality of life without proper mitigation.
   CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. The Green Street Historic District is distant from the UPRR Alterative

corridor and would not be affected by the RLE Project.

5. Reassess No Effect finding for the Altgeld Gardens Historic District based on the UPRR Alternative. The proposed station and garage would alter the landscape; a rendering should be developed.
   Altgeld Gardens Historic District is eligible for NRHP listing under Criterion A (i.e., events that have made a significant contribution to the broad patterns of American history on a local, state, and/or national level) based on its association with community development, planning, and social history. As defined by 36 CFR 800.5, an adverse effect on this resource would be an "alteration to the characteristics of a historic property qualifying it for inclusion in or eligibility for the NRHP." While the UPRR Rail Alternative would increase transportation choices and improve access for this geographically isolated area, none of the proposed infrastructure improvements in the vicinity would significantly alter the characteristics that qualify the district as eligible for NRHP listing. As part of the UPRR Rail Alternative, an at-grade station and parking facilities would be constructed in one of two locations to provide access to the Altgeld Gardens Housing Project: a South Station Option or a West Station Option. Either station location option is separated from Altgeld Gardens Historic District by a multi-lane street (i.e., E. 130th Street and/or E. 130th Place). Preliminary plans for each terminal station option would include parking for 2,300 vehicles through a combination of a parking structure and surface parking lots.

   The South Station Option parking structure for the UPRR 130th Street Station is approximately 800 feet from Altgeld Gardens Historic District at its closest point; the parking structure would not be visible from within the historic district and would not adversely affect the historic district.

   The West Station Option parking structure for the UPRR 130th Street Station is approximately 400 feet from Altgeld Gardens Historic District at its closest point and would only be visible from the outer line of buildings on the north side of the Altgeld Gardens development. This outer row of buildings would obstruct the view of the parking structure from interior buildings and streets. The construction of the West Station Option would not adversely affect the characteristics that qualify the district as eligible for NRHP listing, i.e. its association with community development, planning, and social history.

   As the project would not adversely affect the integrity of the district or its association with community development, planning, and social history, any visual simulation rendering and any appropriate mitigation measures identified would occur independent of the formal Section 106 consultation process for this resource.

   The UPRR Alternative has been selected as the National Environmental Policy Act (NEPA) Preferred Alternative, and an additional rendering of the station will be developed and presented as part of the Draft EIS to assist local stakeholders in understanding the extent of visual impacts created by the project.

6. Reassess No Effect finding for the Roseland Pumping Station based on the UPRR Alternative.
   For the UPRR East Option, the track structure is approximately 8.8 feet from the side of the building at its nearest point. It should be noted that an existing at-grade freight line runs in close proximity to this location. The pumping station would not be displaced or directly affected by the UPRR Rail Alternative. The changes in the setting (e.g., visual, noise, vibration, etc.) would

not adversely affect the characteristics that qualify the resource as eligible for NRHP listing, i.e. its architecture.

The UPRR West Option would also not affect the characteristics that qualify the resource as eligible for NRHP listing.

7. CTA should develop appropriate renderings for all properties in the APE where there was a finding of No Adverse Effect or Adverse Effect.
   CTA will develop additional visual simulation renderings, for inclusion in the Draft EIS, of the UPRR Alternative, which has been selected as the NEPA Preferred Alternative. Renderings are particularly helpful in understanding the extent of visual impacts and in developing appropriate mitigation measures for any adversely affected historic resources.

   At the current stage of Effects consultation, additional renderings would not change the effects findings for NRHP-eligible resources. Justification for effects findings was provided in the effects report mailed to consulting parties and additional justification is included in this document. As a reminder, the key consideration is whether the project would alter the specific characteristics that qualify a resource as eligible for the NRHP.

   In addition to the Historic impacts, the Draft EIS will also include a discussion of the potential visual impacts of the RLE Project alternatives, including general renderings of the alternatives that were prepared to assess those impacts. Some of those renderings were also presented at the May 13th CTA open house and the exhibit boards can be viewed at http://www.transitchicago.com/assets/1/red_ahead/MS_CWC_CL_RLE_Exhibit_Boards_lowres_FINAL_20140515.pdf

8. Renderings should be developed for any NRHP or Chicago Historic Resources Survey (CHRS) Orange properties potentially impacted by the close proximity of the proposed elevated track structures.
   See Response #7.

9. The property owner of the Galloy and Van Etten Stone Contractors business is concerned about their access and viability if the Halsted Alternative is built.
   CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. The Galloy and Van Etten Stone Contractors business is distant from the UPRR Alternative corridor and would not be impacted.

10. Noise studies should be undertaken to demonstrate that the introduction of the elevated rail structure on Halsted would not adversely affect historic resources within the APE of that route.
    CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. Noise analysis has been conducted per Federal Transit Administration (FTA) guidance and mitigation measures have been identified, which will be presented in the Draft EIS.

11. The French Eclectic House would experience the same impacts as Green Street. Scale and noise would be issues. These areas could be negatively impacted, driving people to move out of the area.

CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. The French Eclectic House is distant from the UPRR Alterative corridor and would not be affected by the RLE Project.

Other Comments

12. In general, we [IHPA] concur with the findings concerning historic architectural resources presented in the draft report. The Bus Rapid Transit (BRT) Alternative would have the least impacts, followed by the UPRR Alternative.

13. The potential to encounter archaeological resources needs to be addressed. If the potential for undisturbed archaeological resources exists, a survey will be required.
    No previously recorded archaeological sites fall within the RLE APE and therefore the project would produce no effect on known archaeological resources. The need for and extent of further archaeological investigations will be determined in consultation with IHPA.

14. CTA should consider incorporating the city-owned, vacant historic substation (10227 S. Halsted Street) into plans for the nearby station.
    CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued; the vacant historic substation would not be affected by the RLE Project.

Chicago, IL 60661-1498

Dear Ms. Tandon:

Thank you for requesting comments from our office concerning the possible effects of the referenced project on cultural resources. Our comments are required by Section 106 of the National Historic Preservation Act of 1966, as amended, and its implementing regulations, 36 CFR 800: "Protection of Historic Properties".

We are in receipt of the 2014 *Draft Effects Report*, and appreciated the opportunity to participate in the May 8, 2014 meeting at the CTA where your findings were presented. In general we concur with the findings concerning historic architectural resources presented in the draft report. However, the report indicates that noise walls will reduce the amount of noise that resources such as the proposed Green Street Historic District will experience. Noise studies that include current conditions will need to be undertaken to demonstrate that the introduction of the elevated rail structure on Halstead will not adversely affect historic resources located within the APE of that route.

It was noted in the report that archaeological resources may be uncovered during construction activities and that they would be investigated once found. At a minimum, the potential to encounter archaeological resources needs to be addressed and the results need to be presented to this office for review. If the potential for undisturbed archaeological resources exists within the areas of potential effect, a survey will be required.

As previously stated, it is our opinion that the proposed BRT route will affect the least amount of cultural resources located within its APE. We also believe the UPRR route that is often adjacent to existing railroad tracks will affect fewer resources than the elevated line proposed on Halsted Street.

We look forward to reviewing the final historic resources report once the preferred alternative has been selected and all cultural resource surveys have been completed.

If you have questions please contact David J. Halpin, Cultural Resources Manager, at 217-785-4998.

Sincerely,

Anne E. Haaker

RE: Red Line Extension – Potential Effects Consultation Comments

Dear Ms. Tandon,

Thank you for the opportunity to review on May 8th the Red Line Extension team's findings and recommendations regarding historic properties in the APE. We are pleased to see some additions made to the list of National Register-eligible properties and the identification of orange-rated buildings in the Chicago Historic Resources Survey (CHRS) based on our February 18, 2013 letter.

From the May 8th meeting, we have the following comments:

- We strongly recommend that better renderings are produced to illustrate the potential impact of a UPRR West Station and four-story parking garage on 130th Street and the adjacent Altgeld Gardens Historic District.
- We agree with comments made during the meeting that the "No Effect" determination made for the Roseland Pumping Station, 351 W. 104th St., and Altgeld Gardens Housing Project Historic District, under the UPRR Rail scenario, should be reassessed as potentially having an "Adverse Effect" determination.
- We recommend producing renderings that will illustrate the "Adverse Effect" on National Register-eligible properties in the Halsted Rail scenario. This is particularly important if the proximity of rail tracks could potentially make these properties less viable in the future. These properties include:
    - The Former Classic Revival Substation, 10227 S. Halsted St.
    - The S.S. Peter & Paul Catholic Church at 12433-12439 S. Halsted St.
    - Cedar Park Cemetery Entryway and Gatehouse, 12540 S. Halsted St.
    - Fire Department Engine Company 115, 931 W. 120th St.
- While we understand that the design phase of a Halsted Rail scenario, if selected, will be some time later, we would like consideration to be made of incorporating the city-owned and vacant historic substation at 10227 S. Halsted St. into plans for a station that was indicated would be built in that vicinity.
- Lastly, we support the reassessments suggested by Matt Cole of Neighborhood Housing Services in his May 14, 2014 letter.

Again, thank you for the opportunity to review the findings by your team for this project.

Sincerely,
Lisa Di Chiera

RE: Red Line Extension – Potential Impacts to National Register Eligible Properties in APE

Dear Ms. Tandon,

Thank you again for inviting NHS to participate in the Section 106 review process for the Red Line Extension project. We believe that extending the Red Line will ultimately enhance the livability and well-being of the greater Roseland-area. At the same time, as an organization rooted in the use of asset-based community development strategies, we wish to ensure that the project minimizes any undue impacts on the existing residential, community, and historic buildings that make these neighborhoods great and that our experience has shown can be important community-building and engagement assets. Therefore, based on the information presented in the May 9th Effects Meeting, we recommend that the following additional actions be undertaken by the project team before any mitigation planning is undertaken:

- Develop appropriate and assessable renderings for all properties in the APE where there was a finding of No Adverse Effect or Adverse Effect. This currently includes the Former Venetian Hall, the Green Street Historic District, the Former Classical Revival Substation, Galloy and Van Etten Stone Contractors, S.S. Peter & Paul Catholic Church, Cedar Park Cemetary Entryway and Gatehouse, and Fire Department Engine Company 115. We also believe that such renderings should be created, as necessary, based on our recommendations below (e.g, re: Altgeld Garden Historic District).

- Re-Survey 103rd Street to 104th Place between the UPRR and Princeton Avenue: This area includes the previously identified, National Register-eligible Roseland Pumping Station and Roseland Fire Station properties. However, the blocks also include a largely intact and well-maintained grouping of Chicago bungalows and frame cottages. We would encourage the project team re-survey these blocks to determine if these residential properties could contribute to a future National Register district, as well as any potential impact that a UPRR-located elevated train line would have on such a district.

- Reassess Determination that Cast Stone-faced Residences in APE are not National Register Eligible: Several of these buildings, which look similar to Chicago Greystones and are relatively rare, were observed adjacent to the UPRR right-of-way. This includes the 2-flat on Kensington Avenue immediately east of the Former Venetian Hall.

- Reassess Finding of No Adverse Effect on Potential Green Street Historic District: Re-evaluate visual, noise, and economic effects of a Halsted-located elevated train line on homes along Green

Street. While such train lines do run through other residential areas of Chicago (e.g., Pink Line), this corridor would be new and could have a significant impact on the quality of life of the area without proper mitigation.

- Reassess Area Around 111th Street and Emerald Avenue for Potential Historic District: Re-survey area around 11310 South Emerald (Emerald, Union, and Wallace Avenues) for eligibility as a historic district. If determined eligible, assess effect of a Halsted-located elevated train line on the district.

- Reassess Finding of No Effect of a UPRR West Station on Altgeld Gardens Historic District: The proposed station, station house, and four-story parking garage would be located immediately to the north of Altgeld Gardens. The height of the parking garage would be taller than any other properties in the area and would likely loom above the landscaped tree line of 130th Street. The existing rendering of the proposed station developed by project team is inadequate to assess the effect of the station due to its oblique view from the west.

Thank you again for inviting NHS to participate in the Section 106 review for the Red Line Extension project. Please let us know if we can be of further assistance before the next scheduled consultation.

Best,

Matt Cole

Subject: Red Line Extension Historic Properties Consultation

Dear Ms. Tandon,

Thank you for hosting the consulting parties meeting held at CTA headquarters on May 8, 2014 for the Red Line Extension Historic Properties Consultation. We appreciate the opportunity to comment on the draft effects to historic properties that were discussed at that meeting.

Based on information provided, our comments are as follows:

1. Properties determined to be historic and/or color coded orange in the Chicago Historic Resources Survey and that would be potentially impacted by close proximity of elevated tracks under any of the alternative routes being considered should have photo renderings executed to show the effect of such close proximity of tracks. This would mainly include properties along the Halsted St. alternative, but would also include the UPRR east alternative route as it would affect the Roseland Pumping Station.

Our office looks forward to continuing to work with you on this exciting undertaking.

Sincerely,

Terry Tatum

Section 1 - Introduction

The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the existing terminal at 95th/Dan Ryan to 130th Street. The proposed 5.6-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include Park & Ride facilities and bus connections. In 2018, CTA selected the Preferred Alignment as shown in **Figure 1-1**.

The Preferred Alignment for the Red Line Extension (RLE) Project would run south along I-94 from the 95th/Dan Ryan terminal, then curve west along the north side of I-57 between 97th and 98th Streets (within the I-57 right-of-way) until it reaches the Union Pacific Railroad (UPRR) corridor adjacent to Eggleston Avenue. The alignment would then run south to follow the UPRR corridor for approximately 1 mile. The extension would follow the UPRR corridor, on the west of the existing UPRR corridor, to 108th Street, where it begins traveling east and crossing over the existing UPRR corridor and going south along the east side of the UPRR Corridor to the 111th Street station.

The proposed rail extension would then continue running in a southeasterly direction along the east side of the UPRR corridor to 119th Street where it crosses over the Canadian National and Metra rail corridor between Kensington Park on the southwest and Front Avenue on the northeast. The extension then continues southeast leaving the UPRR corridor and crossing over the Norfolk Southern Railroad (NS) corridor. The extension then continues southeast along the NS corridor running along the east side of the NS tracks. A new shop and yard would be located at 120th Street. Slightly northwest of 124th Street the extension would cross back over the NS tracks and begin running along the west side of the tracks and adjacent to Cottage Grove Avenue on the west until crossing under 130th Street where it terminates on the east of side of Altgeld Gardens, west of Carver Military Academy High School.

Figure 1-1: Preferred Alignment

Appendix B contains historic plat maps from 1861, 1870, 1886, 1890, 1898, and 1929, as well as 1938 historic aerials, and 1911 Sanborn Fire Insurance Maps. These maps show the development of residential and commercial properties, and railroads along the Preferred Alignment. Archaeologically, this demonstrates that the ground has been disturbed and there is a very low chance of intact subsurface deposits.

From June 15 to June 16, 2020 Midwest Archaeological Research Services (MARS), conducted a Phase I archaeological reconnaissance survey on the Preferred Alignment. The project area is in portions of Sections 4, 9, 16, 21, 22, 26, 27, and 35 of Township 37 North, Range 14 East (Calumet) of the Third Principal Meridian (**Figures 1-2 and 1-3**). MARS archaeologists did not identify any cultural material within their 53 excavated shovel probes during the Phase I archaeological survey (**Appendix A: Figures 5-7, 28-29**). Additionally, no recorded archaeological sites would be impacted during construction of the Preferred Alignment. **MARS recommends project clearance**.

Section 2 - Federal and State Guidelines

This section discusses the applicable federal and state regulations.

2.1 Federal

Among the federal laws and regulations that address the protection of archaeological resources are the National Historic Preservation Act (NHPA), the National Environmental Policy Act (NEPA), and the Department of Transportation Act of 1966. These laws and regulations resulted from the recognition that historic resources provide valuable opportunities to study human behavior and to plan for the future while conserving and protecting these resources and environments. Methods employed during the archaeological investigation associated with the RLE Project were conducted in accordance with the applicable federal laws and regulations as well as with the Secretary of the Interior's *Standards and Guidelines*.

2.2 Illinois State Guidelines

Pertinent state laws, regulations, and guidelines relating to the proposed undertaking include the Human Skeletal Remains Protection Act of 1989 and the Illinois Archaeological and Paleontological Resources Act of 1989. The Illinois State Museum maintains site files for archaeological sites, available online to qualified researchers.

Reconnaissance surveys are conducted to identify possible prehistoric or historic remains on landscapes scheduled for modification. Identification of any such non-renewable cultural resources allows land managers to plan adequate preservation or mitigation measures. Field methods employed during the survey were in accordance with the Illinois State Historic Preservation Office Guidelines for Archaeological Reconnaissance Surveys and Reports.

Section 3 - Physical Setting

The RLE Project would be wholly contained within the exceptionally flat, crescent-shaped Chicago Lake Plain. The approximately 45-mile by 15-mile plain occupies the exposed floor of glacial Lake Chicago. Relief within the lake plain varies only 10 feet above the former lake floor where sand spits, dunes, and beaches formed near the shoreline during one of three high water stages of Lake Chicago (water levels at 600–620 feet)—Glenwood Stage, Calumet Stage, and Tolleston Stage.

The project area includes lake plain-associated surface features such as Calumet Stage beach ridges, the Washington Heights Spit, and the Stewart Ridge Spit (Bretz 1939:105, 108).

Philip C. Hanson (1981), then with the Field Museum of Natural History, used the General Land Office survey notes and plats to reconstruct pre-settlement vegetation within the Chicago Lake Plain. Hanson's analysis (1981:160) identified nine plant communities within the lake plain, with wet prairie, prairie, and oak savanna plant communities mapped along the RLE Project corridor. The savanna community, dominated by black oak and bur oak, is associated with the sandy beach ridges and spits in the “Calumet area” at the southern end of the lake plain (Hanson 1981:161). The beach ridges and spits provided dry, elevated landforms suitable for habitation sites and for travel by land. The wet prairie community is mapped south of the “Old Indian Reservation Boundary” line shown on the U.S. Geological Survey quadrangles, between the Little Calumet River (south) and Lake Calumet (north). Hanson (1981) mapped prairie north of the boundary line. Surface water drains into Lake Michigan by way of the Little Calumet, Calumet, and Grand Calumet Rivers, unless artificially diverted into the Calumet-Saganashkee Canal.

Section 4 - Cultural History of Region

This section contains a brief description of the natural landscape features that influenced the prehistoric development of the area, followed by a description of the prehistoric context for the Paleoindian, Archaic, Woodland, Mississippian, Proto-Historic, and Historic Periods.

Although humans probably entered North America from Asia at least 20,000 years ago, solid evidence for their presence in the Midwest before 10,000 B.C. is elusive. From the time of the initial arrival until the arrival of the Europeans in the 17th century, the archaeological record shows evidence for continuous population growth and changing social adaptations to new developments in both the natural and cultural landscape.

The recorded sites represent only a small percentage of the prehistoric cultural resources within the Chicago area, as substantial numbers of sites have been destroyed by urban development or were found by amateur archaeologists or relic collectors but have not been reported. Other sites remain undiscovered on unsurveyed land.

4.1 Paleoindian Period (10,000 to 8,000 B.C.)

During the Paleoindian Period, populations across the Midwest were highly mobile bands of hunters and gatherers occupying large territories. The Paleoindians hunted a variety of mammals including the now extinct mammoth and mastodon, elk, and deer, and gathered locally available plants. Sites within the Chicago area dating to the Paleoindian Period are rare, although individual tools are more common.

The stone tools most often associated with this period, fluted projectile points and knives, are occasionally recovered as isolated finds in upland areas and along the margins of large river valleys and ancient lake beds. Many archaeological sites in the Chicago Lake Plain dating to the Paleoindian Period have been either destroyed by erosional processes or buried by natural deposition.

4.2 Archaic Period (8,000 to 1,500 B.C.)

The long Archaic Period was a time of transition in the Midwest. After the final retreat of the glaciers, subsistence pursuits adjusted to the changing natural environment as deciduous forests replaced coniferous forests and as the prairie expanded to the east. Human population densities gradually increased, mobility decreased, resource exploitation and technology became more diverse and localized, and social organization became more complex.

During the Archaic Period, hunting began to focus on deer as the primary source of meat. A variety of smaller animals and fish were also collected with increased emphasis on aquatic resources throughout the period. Plant foods including tubers, nuts and seeds became increasingly important subsistence items. Some native plants, such as goosefoot, sumpweed, and possibly native squash or gourd, may have been domesticated during the latter part of the Archaic. Domesticated dog has been identified at archaeological sites in the Midwestern United States.

New tool types were developed including new forms of spear or projectile points, the chipped stone adze, ground stone tools, copper tools, stone mortars for processing plants, and ornaments from bone, shell, and copper. The first cemeteries in Illinois appear during the Middle Archaic and late in this period; graves were occasionally covered with low mounds of earth. Toward the end of the Archaic Period, groups had established particular territories within which settlements were shifted to exploit the seasonally available natural resources. Networks for the exchange of resources within and between regions also developed toward the end of the Archaic Period.

4.3 Woodland Period (1,500 B.C. to A.D. 1,000)

The onset of the Woodland Period is traditionally marked by the introduction of pottery technology; however, in the southern Midwest, pottery was manufactured as early as 2,500 B.C., well within the Late Archaic.

Early Woodland patterns of settlement, subsistence, and social organization were probably not very different from those of the Late Archaic. Hunting and fishing remained focal subsistence activities. While nuts continued to be an important food item, seeds played an increasingly important role, although plant cultivation did not account for the bulk of subsistence calories. Sunflower may have been added to the list of domesticated plants at this time. Data from the Lower Illinois Valley and the Mississippi River in Illinois suggest that Early Woodland groups focused on river bottom resources during at least part of the year. Early Woodland sites are identified by the occurrence of the first pottery vessels and by particular forms of projectile points and other stone tools and the construction of substantial earthen burial mounds.

During the Middle Woodland Period, settlements in the Midwest tended to concentrate along broad river valleys. Burials were placed in mounds on nearby bluffs, possibly serving as territorial markers. Sites were occupied for longer periods of time during the year and by greater numbers of people than in preceding periods. Subsistence activities focused on harvesting the abundant seed plants of the floodplain as well as on raising some native domesticates. Deer, fish, and a variety of small mammals and birds were also important food resources.

During the late Middle Woodland and early Late Woodland, the trade of long distance materials came to an end. Mortuary activities became less complex, and settlement patterns changed. There appears to have been a radical reorganization of social and economic systems in the Midwest, the impetus for which is currently unclear. Throughout the region, Late Woodland appears to have been a period of population growth and expansion with settlements no longer restricted to broad alluvial river valleys. Late Woodland sites are found in a variety of topographic settings, sometimes in the same locations as earlier Archaic sites. The hierarchy of sites present during the Middle Woodland disappeared and Late Woodland settlement systems apparently consisted of small seasonal villages and associated support camps.

Although subsistence continued to be based on hunting, fishing, and the gathering of plants, corn horticulture began to be increasingly important in the economy. The quantity and diversity of seeds recovered from Late Woodland period sites indicate extensive use of this resource in the subsistence strategy.

Seven of the twelve sites (11Ck15, 11Ck28, 11Ck246, 11Ck246, 11Ck248, 11Ck249, 11Ck250) recorded within 1 mile of the project area contain artifacts diagnostic of the Woodland Period (Discussed in **Section 5**).

4.4 Mississippian Period (A.D. 1000 to A.D. 1600) and Proto-Historic Period (A.D. 1600 to A.D. 1673)

Mississippian subsistence was characterized by an increasing reliance on cultivated plants, particularly corn and squash. Beans enter the archaeological record for the first time in the Midwest late in the period. Deer was the most important faunal resource, although migratory waterfowl, elk, bison, fish, and raccoon also made varying contributions to the protein intake.

The Proto-Historic Period is the time of trade and contact between Native Americans and Europeans in the region.

Three of the twelve sites (11Ck28, 11Ck246, 11Ck248) recorded within 1 mile of the project area contain artifacts diagnostic of the Mississippian Period (Discussed in **Section 5**).

4.5 Historic Period (1673 to Present)

Historic Indian tribes known to have inhabited northeastern Illinois during this time include Fox (Mesquakie), Kickapoo, Mascouten, Menominee, Miami, Ojibwa (Chippewa), Ottawa (Odawa), Potawatomi, Winnebago (Ho-Chunk), and Sauk (Tanner 1987:93, 98, 106, 140). The Potawatomi were firmly established in the vicinity when the settlers arrived following the Black Hawk War of

1832. Portage points and river junctures along the waterways were important locations for Native American encampments and villages, and Euro-American trading posts, towns, and forts.

Trails around the head of Lake Michigan (Calumet Region) skirted the lakeshore or used beach ridges to cross the Chicago Lake Plain. The 1819 General Land Office plat notes an “Indian Trail” passing along the western shore of Lake Calumet. The Bishop Ford Freeway and Cottage Grove Avenue follow the approximate alignment of the old trail within the project area. Outside the project area, the trail continues to the southeast aligned with State Street through Calumet City. The “Indian Trail” joined Scharf’s Trail P, a branch of the historic Chicago-Vincennes Trace (Quaife 1923:51-71), at about Kensington (near center of Section 22). James Rees’ 1851 map and Albert Scharf’s 1901 map of *Indian Trails and Villages of Chicago* (1901) show Trail P crossing the Little Calumet River at the toll bridge, established by George Dolton and Levi Osterhoudt in 1842, at Riverdale Crossing (aligns with Indiana Avenue and Vincennes Avenue). The General Land Office “Indian Trail” and Trail P are branches of the Chicago-Vincennes Trace.

Railroads followed the same general alignments as the early trails around the head of the lake from the eastern states into Chicago. The Illinois Central Railroad appears on the 1870 plat of Calumet Township and aligns with Trail P while the Michigan Central Railroad appears on the same plat aligned with the “Indian Trail.” The rail lines, as the trails before them, join at Kensington (Van Vechten 1870).

Sources of information about the Historic Period include accounts of traders, missionaries, Indian agents, surveyors, military personnel, travelers, and settlers as well as the insights gained from archaeological investigations.

Two of the twelve sites (11Ck1226 and 11Ck1240) recorded within 1 mile of the project area contain artifacts diagnostic of the Historic Period (Discussed in **Section 5**).

The Preferred Alignment is located within three neighborhoods/communities (Roseland, West Pullman, and Riverdale). The historic development of these three neighborhoods/communities is discussed by community in the following subsections.

4.5.1 Roseland Community

The Roseland community, which is approximately 12 miles south of Chicago’s Loop, is bounded by train tracks on the north, 115th Street on the south, Cottage Grove Avenue on the east, and Halsted and Stewart Streets on the west. The community is served by public transportation via the CTA Red Line station at 95th Street, the last stop on this line, and by the Metra with four stops between 103rd and 115th Streets.

The Roseland community was undeveloped wet prairie with occasional patches of dry prairie in the mid-19th century. The Chicago-Thornton Road (now Indiana Avenue), which was built on high prairie, crossed the community. Initial settlement occurred in 1849 when a group of Dutch families from the district between Amsterdam and Rotterdam in Holland, in search of land for truck farming, established a settlement of frame houses along this road between 103rd and 111th Streets (Andreas 1884:607).

The immigrants became known as the “Hollanders of the High Prairie,” and cultivated cabbage, cauliflower, beets, carrots, potatoes, and tomatoes, which they hauled to Chicago’s South Water Street Market on the Chicago-Thornton Road. More Dutch immigrants settled the low-lying land between the high prairie and Lake Calumet to the east. Some of the Dutch worked on the construction of the new railroads. The community was called Hope when the first post office was opened in 1861 and was initially part of the Lake Township. In 1867, the area east of State Street became part of the newly incorporated Village of Hyde Park (Chicago Fact Book Consortium 1995:152). The Dutch truck farmers also grew flowers, and the lavish annual display of red roses led to the adoption of the name of Roseland for the community in the 1870s.

Roseland’s transformation to an urban community began in the 1880s with the establishment of the Pullman Palace Car Company to the east and the development of several additional railroads along the borders of the area. The annexation of both Lake Township and the Village of Hyde Park in the early 1890s brought Roseland within Chicago’s city limits. The Calumet region became steadily industrialized during the 1890s as the Illinois Central Railroad built its Burnside shops in the northeast section of Roseland.

In 1920, Roseland’s population stood at 28,241 and an abundance of undeveloped land remained throughout the community. This situation was to quickly change during the decade to follow, when Roseland’s population rapidly increased with an influx of Lithuanians, Italians, Germans, and a small number of African Americans. The accompanying building boom of the 1920s transformed Roseland into a mature residential community and vacant parcels were improved with one- to two-story gable-roofed wood cottages, brick bungalows, and wood frame homes in the popular American Foursquare style.

During the 1950s and 1960s, Roseland served as a community—albeit on its northern end only—where African Americans could purchase a home and build a future. Construction of the Dan Ryan Expressway during the late 1950s cut a wide swath through Roseland’s north end. This dramatic intervention on the urban landscape resulted in the demolition of many homes and physically divided this area from the remainder of the community to the south. Roseland’s vacant edges were developed from the 1950s through the early 1970s with clusters of identical one-story and split-level tract homes.

4.5.2 West Pullman Community

The West Pullman community, approximately 16 miles south of Chicago’s Loop, is bounded by 115th Street to the north, 123rd Street and the Little Calumet River to the south, Front Street and railroad tracks to the east, and Ashland Avenue, Halsted Street, and Morgan Street (city limits) to the west.

The first settlers in the area known as West Pullman were civil engineer and land surveyor David Andrews and his wife Caroline, who married in 1840 and established a 360-acre farm near the northeast corner of the future community. The couple only had two neighbors who were about 3 miles away, and at that time, "prairie wolves, deer, and prairie chickens abounded, and occasionally a lynx was seen" according to A. T. Andreas in his *History of Cook County* (1884:603). The first signs of change arrived in 1852, when the Illinois Central Railroad and Michigan Central Railroad companies established the Calumet Station at the present intersection of 115th Street and Cottage Grove Avenue. A settlement grew slowly around the Calumet Station and came to be called Kensington, initially consisting of a general store and saloon at the corner of Front Street and Kensington Avenue, wood shanties, and a boarding house inhabited by men working on freight handling for the railroads.

In 1920, West Pullman had a population of 23,019 and still featured large areas of undeveloped land. This was to change during the citywide construction boom of the 1920s, during which vacant parcels throughout the community were improved with bungalows and two-flat residential buildings in frame and brick, homes designed in the popular American Foursquare style, and small brick apartment buildings.

West Pullman's population rose from 29,000 in 1950 to 35,000 in 1960, a period in which Poles, Italians, and Germans predominated among the whites, who constituted nearly 100 percent of the community's population (Chicago Fact Book Consortium 1995:161). Vacant lots throughout the community and along its undeveloped southern and western edges were improved during the post-War period with suburban style tract homes and split-level homes, as well as duplexes, many of which were on the south, north, and west sides of the factory district. Starting in the 1960s, some of the vacant land on West Pullman's western edges finally opened to African Americans, such as the Maple Park subdivision.

4.5.3 Riverdale Community

The community of Riverdale—distinct from the adjacent Village of Riverdale to the southwest—is approximately 16 miles south of Chicago's Loop. It is bounded by the Bishop Ford Expressway (I-94) on the east, the Illinois Central Railroad on the west, 115th Street on the north, and the Chicago city limits (138th Street) on the south. The northern two-thirds of the community is occupied by rail yards, industry, and the Calumet Sewage Treatment Plant, while residential development is concentrated south of 130th Street and east of Indiana Avenue.

The earliest settler in the Riverdale area was George Dolton, who arrived with his wife and seven children in 1835. He was joined near the banks of the Little Calumet River by several other pioneers over the next few years, including J. C. Matthews. Dolton and Matthews operated a ferryboat across the river starting in 1836. In 1836, Dolton and another settler, Levi Osterhoudt, built a toll bridge across the river, which they operated until 1842 when it was purchased by the county (Goodspeed and Healy 1909:317). The area grew slowly as a truck farming community that provided produce to Chicago. Early farmers were soon joined by Dutch and Swedish railroad workers during construction of the Illinois Central tracks through the area from 1850–1852 (Andreas 1884:601-602).

Riverdale's industrial development had its beginnings in the 1860s, when widespread truck farming gave rise to establishments that processed foods, such as a sugar beet refinery founded in 1865. The Union Copper Distilling Company of Chicago established the Riverdale Distillery in 1871, and by 1883, the company employed an average of 50 men and boasted a profit of $1.5 million. In the late 19th century, Riverdale was also home to lumber yards and planning mills operated by the Riverdale Lumber Company, which was established in 1879, and by the Calumet Lumber Company (Andreas 1884:602). Several railroads were built through the area between 1852 and 1880, claiming large parcels of land for their right-of-ways and yards. In addition to the Illinois Central, the railroads included the Pittsburg, Cincinnati, Chicago and St. Louis Railroad, and the Chicago and Eastern Line.

By the start of the 20th century, the land in the northern two-thirds of the community had become increasingly industrialized. In 1902, Sherwin-Williams enlarged its 116th Street facility with new buildings on an additional 10 acres purchased that year from the Pullman Land Company. Over the next half century, the company's Riverdale plant grew to encompass 100 acres, which included land once used by the Pullman Farm. It became one of the largest paint factories in the world, capable of making the complete product, from raw material to container (*Chicago Tribune* 1902, Sherwin-Williams 2008).

World War II revitalized industries on Chicago's Far South Side and stimulated demand for low-cost war-worker housing for African Americans. The response of the federal government and the Chicago Housing Authority (CHA) was construction of the Altgeld Gardens public housing project on an immense 157-acre tract of vacant land between 130th and 133rd Streets, from Langley to Greenwood Avenues. Construction started in November 1943 and the complex was dedicated before a crowd of 5,000 people on August 26, 1945 (Chicago Tribune 1945, Bowly 1978: 42).

Section 5 - Archaeological Sites in Project Vicinity

Based on collections of artifacts made by amateur archaeologists Albert Scharf, Oscar Biedes and Ed Lace, as well as professional investigations completed by the Illinois State Archaeological Survey and Midwest Archaeological Research Services, twelve archaeological sites have been recorded within 1 mile of the RLE Project vicinity, although none fall within the proposed construction corridor. The sites are listed in **Table 5-1**.

Table 5-1. Archaeological Sites within 1 mile of the Project Vicinity

Site #	Site Name	Recorded	Archaeologist	Temporal
11Ck15	-	1955	David J. Wenner	Middle Woodland
11Ck28	-	1957	Elaine Bluhm	Middle Woodland, Upper Mississippian
11Ck177	-	1959	Betty Broyles	Prehistoric
11Ck244	Flatfoot Lake South	1987	Ed Lace	Late Woodland
11Ck245	Flatfoot Lake North	1987	Ed Lace	Prehistoric
11Ck246	Flatfoot Lake Central	1987	Ed Lace	Late Woodland, Upper Mississippian
11Ck247	Beaubien Woods	1987	Ed Lace	Prehistoric
11Ck248	-	1987	Ed Lace	Middle Woodland, Upper Mississippian
11Ck249	Beaubien Woods South	1987	Ed Lace	Woodland
11Ck250	-	1987	Ed Lace	Middle Woodland
11Ck1226	Block House B	2016	Jay Martinez	Historic-Pullman
11Ck1240	-	2017	Lindsay Dyle	Historic

Source: Illinois Inventory of Archaeological Sites. Accessed on September 14, 2020.

Site 11Ck1240 is located ¾ of a mile to the north of the CTA 95th/Dan Ryan station (**Figure 5-1**). Site 11Ck1226 is located approximately 1 mile to the east of the proposed construction corridor in the historic Pullman District (**Figure 5-2**).

Historic site 11Ck1240 was recorded by Lindsay Dyle in 2017. This historic artifact assemblage was collected during a shovel test survey of a vacant grass lot. Historic site 11Ck1226 was recorded by Jay Martinez with Midwest Archaeological Research Services Inc. in 2016. The artifacts were recovered from the front yard of a razed brick Block House and represented dumping activities.

Source of Map is Bing Aerial Imagery 2020

Figure 5-2: Archaeological Site within 1 mile

Sites 11Ck15, 11Ck28, 11Ck177, and 11Ck244 through 11Ck249 are near Flatfoot Lake within the 135-acre Beaubien Woods Forest Preserve of Cook County. Flatfoot Lake is approximately ½ of a mile to the southeast of the proposed 130th Street station (**Figure 5-3**).

David J. Wenner recorded 11Ck15 based on a collection of Middle and Late Woodland sherds, flint tools and chips. When the site was recorded in 1955 it had been mostly destroyed by mining a gravel pit. It was originally within woods and an agricultural field.

Elaine Bluhm and David J. Wenner recorded site 11Ck28 based on a collection of grit-tempered and shell-tempered ceramics gathered from the site and held by Theodore Shapas. The site dates to the Middle Woodland (grit-tempered sherds) and Upper Mississippian (shell-tempered, Oneota sherds) periods.

Betty Broyles recorded 11Ck177 in 1959 as comprising the village (Ckv125 and Ckv126) and associated mounds (11Ck127 and 11Ck128) detailed by Chicago tobacconist and avocational archaeologist Albert Scharf in 1919. "Two mounds and a camp site were located along the bend of the river" (Brown 1917). Regarding the Calumet Marshes, Scharf (1919) notes: "The several Indian villages in these marshes were all located along the canoe routes or portage trails of which they form the route simply passing from one to the other and together we have one of the links of the great highway leading from the Illinois River to the 'Great Lake.' "—Manuscript transcribed and on file at MARS.

David J. Keene and Theodore J. Karamanski (1980) reported sites 11Ck244 through 11Ck249 in 1979 during survey work completed for the Forest Preserves of Cook County. Ed Lace, an avocational archaeologist with the Forest Preserves of Cook County with whom Keene and Karamanski had worked on the project, formally recorded the Woodland Period and undefined prehistoric sites in 1987.

11Ck250 also identified by Ed Lace is located just to the north of Beaubien Woods Forest Preserve of Cook County at the current location of Carver Military Academy High School (**Figure 5-3**). An undated newspaper article from the Star-Tribune shows photographs of the Oscar Bidese collection (included with the 11Ck250 site form). Site 11Ck250 was destroyed during the construction of the building at 13100 South Doty Avenue.

The Preferred Alignment would not impact any of the 12 recorded archaeological sites that are located within 1 mile.

Figure 5-3: Archaeological Site within 1 mile

Section 6 - Field Methods

From June 15 to June 16, 2020 Midwest Archaeological Research Services (MARS), conducted a Phase I archaeological reconnaissance survey along the Preferred Alignment. Field methods employed during the survey were in accordance with the Illinois State Historic Preservation Office Guidelines for Archaeological Reconnaissance Surveys and Reports. The Archaeological Survey Short Report can be found in **Appendix D.** This short report is required with all Phase I reconnaissance survey projects.

Due to the majority of the Phase I survey area consisting of substantially disturbed inner-city terrain, the primary method of investigation was photographic recordation followed up with shovel test probes in surveyable areas. Shovel tests were excavated as specified by the Illinois State Historic Preservation Office. Shovel test probes (STP) are small subsurface sampling units approximately 14 inches in diameter and 14 to 20 inches deep that are excavated at 50-foot intervals across the project area. Soils from the probes were screened through ¼ inch hardware cloth. The summary of the shovel test probes taken can be found in **Appendix F**.

With the exception of one area, the entire project area contained non-excavatable soils (gravels or wetland areas): Orthents or Urban Land (USDA 2020 and **Appendix E**). The one area that contained excavatable soils (likely disturbed during railroad and roadway construction) for shovel tests was located along Eggleston Avenue (STP Area 2: see below and **Figure 6-1**). Photographs were taken with the 16 MP Samsung S10e smartphone camera along the project area at prearranged locations. A total of 166 photographs were taken with 90 images selected as the best representation of the landscape. The 90 selected photographs are included in this report (**Appendix C**).

The northern portion of the project area starts at 95th Street and heads south along Interstate 57 (**Appendix A: Figures 2-4**). No shovel tests were excavated within this portion because the ground has been disturbed due to road construction. A total of five photographs were taken to document the route and disturbance (**Appendix A: Figures 2-4** and **Appendix C: Plates 1-5**).

The Preferred Alignment crosses over Interstate 57 and is adjacent to the northwest corner of Wendell Smith Park (**Appendix A: Figure 5**). This wooded area along the railroad tracks and interstate was disturbed due to road and railroad construction. No shovel tests were excavated within this portion. A total of three photographs were taken to document the route and disturbance (**Appendix A: Figure 5** and **Appendix C: Plates 6-8**).

The Preferred Alignment crosses over 103rd Street and heads south on the west side of the existing UPRR tracks for approximately 0.63 miles to 108th Street (**Appendix A: Figures 7-10**).

This stretch of the project area contains residences, commercial buildings, and vacant concrete lots (**Appendix C: Plates 13-23**). Some of the project area was located on the eastern side of the railroad tracks (**Appendix A: Figures 7 and 9** and **Appendix C: Plates 13 and 18**). No shovel tests were excavated within this portion between 103rd Street and 108th Street. The entire section was previously disturbed by residential and commercial development. Development and disturbance began in these areas as early as the 1930's (**Appendix B: Figure 10**). While the current aerial images show grass and vegetation on some of the vacant lots (**Appendix A: Figures 8-10**), visual inspection by MARS archaeologists determined that all vacant lots had either concrete or gravel on the surface preventing shovel testing**.**

From south of 108th Street the Preferred Alignment is on the east side of the existing UPRR tracks heading south then southeast for approximately 1.75 miles to near 119th Street (**Appendix B: Figure 18**). This stretch of the project area contains residences, commercial buildings, and vacant concrete lots (**Appendix C: Plates 24-51, 76-77**). Some of the project area was located on the western side of the railroad tracks (**Appendix A: Figures 11, 12, 15, 16** and **Appendix C: 29, 30, 31, 40, 42, 43, 44, and 45**). No shovel tests were excavated within this portion between 108th Street and 119th Street. The entire section was previously disturbed by residential and commercial development. Development/disturbance began in these areas as early as the 1930's (**Appendix B: Figure 10**). While the current aerial images show grass and vegetation on some of the vacant lots, visual inspection by MARS archaeologists determined that all vacant lots were either concrete or gravel on the surface preventing shovel testing (**Appendix C: 29, 30, 31, 40, 42, 43, 44, and 45).**

Near 119th Street the Preferred Alignment crosses the Metra Electric tracks (**Appendix A: Figure 18**). South of 119th Street, the Preferred Alignment continues southeast along the Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad (NICTD/CSS & SBRR) tracks right-of-way to the terminus of the RLE Project at 130th Street (**Appendix A: Figures 18-15**). No shovel tests were excavated within this portion. While current aerial images show these areas to contain a large concrete lot (proposed railyard **Appendix C: Plates 78-79**), woods, and mowed maintained grass, visual inspection of these by MARS archaeologists concluded these areas to be disturbed due to mechanical stripping and the creation of large soil berms likely the result of railroad development (**Appendix C: Plates 63, 83-89**). The ground cover in these areas contained gravel below approximately less than an inch of soil development. Large areas of gravel could be seen mounded or directly on the surface (**Appendix C: Plate 86**). Large portions of the project area contained wetland grasses. The USDA soil maps has this entire area containing Orthents or Urban Land (USDA 2020 and **Appendix E**). While current aerials show a vast portion of woods (**Appendix A: Figures 19-13**), 1938 aerials depict a large railroad yard (**Appendix B: Figure 12**). This area has been disturbed.

Figure 6-1: STP Area 2 (excavatable soils along Eggleston Avenue)

The 130th Street station would be within Altgeld Gardens (**Appendix A: Figures 28-29**). A small portion of this area was amenable to survey (discussed in **Section 7 – Results and Recommendation**). The remaining large portion of the area was not amenable to survey. The ground has been disturbed by residential development. While the current ground surface is mowed grass (**Appendix C: Plates: 70-72, 90**), the 2017 aerial image shows residences built within this area (NETRonline 2020).

At the southern end of the project area just north of present day Altgeld Gardens is an area that contained historic residents and farmsteads that are shown on the 1938 aerial image (**Figure 6-2**). The historic homes and farmsteads are highlighted with green boxes. MARS visually inspected these areas and used a historic probe to check for ground disturbance. The soil probe indicated gravel beneath the surface in these areas. All of the potential historic sites had disturbed ground surfaces. None of these potential historic archaeological sites had any structure or foundation remnants remaining and all structures have been razed.

Section 7 - Results and Recommendation

Three transects of shovel test probes (STPs) were excavated in areas with a ground surface visibility of less than 25 percent and of lesser disturbance. The STPs were dug at 50-foot intervals by shovel and screened through ¼ inch hardware cloth. Each transect was placed in probable zones named STP Area 1, STP Area 2, and STP Area 3. A total of 53 shovel probes were excavated. There were 19 STPs in Area 1, 19 STPs in Area 2, and 15 STPs in Area 3. See **Appendix F** for specific data per shovel test probe.

STP Areas 1 and 2 is a narrow stretch of mowed grass located between Eggleston Avenue and the UPRR railroad tracks (**Appendix A: Figures 5-7**). STP Area 1 is located between 99th Street and 101st Street, just west of the UPRR tracks (**Appendix A: Figures 5- 6** and **Appendix C: Plates 9-10**). A typical soil horizon seen in STP Area 1 was a 10YR3/2 very dark grayish brown silty loam down to 8 inches below surface underlain by a very mottled 10YR4/1 dark gray silty clay loam (**Appendix C: Plate 80**). The 19 STPs were dug, from north to south, to an average depth of 8 inches below the surface (**Appendix E**). **No cultural material was identified in any of the excavated shovel probes.**

STP Area 2 is located between 101st Street and 103rd Street (**Appendix A: Figure 7** and **Appendix C: Plates 11-12**). A typical soil horizon seen in STP Area 2 was a 10YR3/3 dark brown sandy loam down to 8 inches below surface underlain by a very mottled 10YR4/1 dark gray sandy clay loam (**Appendix C: Plate 81**). The 19 STPs were dug, from north to south, to an average depth of 8 inches below the surface (**Appendix E**). **No cultural material was identified in any of the excavated shovel probes.**

STP Area 3 is located in the southern end of the project area, just west of the rail line near Altgeld Gardens (**Appendix A: Figures 28-29** and **Appendix C: Plates 69 & 72**). A typical soil horizon seen in STP Area 3 was a 10YR3/3 dark brown silty clay loam down to 8 inches below surface underlain by a very mottled 10YR4/1 dark gray clay loam (**Appendix C: Plate 82**). The 15 STPs were dug, southeast to northwest on both sides of the access road, to an average depth of 8 inches below the surface (**Appendix E**). **No cultural material was identified in any of the excavated shovel probes.**

In summary, MARS archaeologists did not identify any cultural material within their 53 excavated shovel probes during the Phase I archaeological survey (**Appendix A: Figures 5-7, 28-29**). Additionally, no recorded archaeological sites would be impacted during construction of the Preferred Alignment. **MARS recommends project clearance**.
